## PREFACE

In the Modern Business Texts the study of advertising is divided into three parts. First, in the Text on "Marketing Methods," there is a complete presentation of the things that have to be considered by anyone who has anything to market before he sends out his salesmen or prepares his advertising. That Text treats of the plan behind the campaign. After a manufacturer or dealer has studied the things that must precede any selling campaign—trade relations, the product, the market and the methods of reaching the market—he decides to use either personal salesmanship or advertising, or both, to sell his goods. The Text on "Advertising Principles" shows what advertising can do for his business, guides him in choosing the right advertising appeal and treats of what may be called the technique of advertising, writing the copy, preparing the illustrations and getting the advertisement before the public.

There is much more to advertising, however, than the making of a preliminary study and the writing of advertisements. The advertiser has to consider problems of organization, methods of identifying his goods, his relation with agencies, the selecting of mediums, distribution, dealer cooperation and a host of

other things, all of which have an important part in the complete campaign. The present Text deals with the many essential parts of an advertising campaign which have not been considered in preceding Texts in the Modern Business Series. It gathers all the diverse considerations of the advertiser, shows their relation one to another and binds them into a unified whole.

Thruout the Text the point of view is chiefly that of the manufacturer, because the manufacturer's advertising campaign is inclusive of all advertising problems—his dealers' as well as his own. Most of the subjects treated, therefore, will be of interest to the dealer as well as to the manufacturer. In the few cases in which the distributor's advertising campaign presents problems entirely different from the manufacturer's, the problems are treated in the Text on "Merchandising."

# ADVERTISING CAMPAIGNS

## CHAPTER I

### THE PURPOSE OF THE CAMPAIGN

1. *The struggle of business.*—The word campaign signifies careful planning and careful coordinating of effort. Its significance in war and in business is the same. The advertising campaign includes everything done by an advertiser to promote sales thru publicity, all planned in advance, and every part of the campaign is designed to fit into the other parts so that there will be no conflicting effort, no friction—simply a smoothly running machine directed toward the goal of increased sales.

2. *The campaign a modern development.*—The idea of uniting all the advertising of an organization into a strongly centered campaign is one of the latest developments of modern business. Thirty years ago an advertisement was an advertisement. It was thought of as nothing more than a brief announcement, on paper. Advertisements were seldom changed. There was seldom a single underlying thought drawing together all parts of the publicity of a business. Today we find remarkable examples of

unity. While there is more variation in copy and more change in advertisements than there used to be, the same purpose and the same ideas run thru all the publicity of an advertiser. We find advertisers creating an atmosphere around themselves and their goods which is the same in each advertising medium.

A typical example is that of Cluett, Peabody and Company, manufacturer of Arrow Collars and Arrow Shirts. The style of lettering used for the words "Arrow Collars" is the same in all advertisements. There is a similarity in the style of illustrations and in the tone of the copy. This is noticeable whether the advertisement appears in a magazine, on a street-car card, or on a window display. The same illustrations are used in different forms, sometimes with a group of figures and sometimes with a single figure, in street-car cards, posters, window cards, and in every one of the other varied forms of advertising which the company uses. There is a unity of impression, a unity of purpose. Each advertisement supports its fellows. Each is a part of a complete campaign.

3. *Objects of campaigns.*—While thirty years ago most advertising was thought of merely as general publicity, today every advertising campaign is backed by a definite purpose for the accomplishment of a specific object. We have begun to know why we advertise. Some campaigns are purely educational; others are purely competitive.

Occasionally we find a campaign which seems to

have no close relation to the promotion of the business of the advertiser. The *Farm Journal* of Philadelphia takes space in the *Saturday Evening Post* not to advertise the *Farm Journal* but to advertise a bird club to prevent the destruction of American song birds. The practical man asks: "What does the *Farm Journal* get out of it?" The *Farm Journal* gets a valuable list of possible subscribers and a certain amount of prestige thru being associated with a worthy enterprise.

A manufacturer of tarred roofing conducts an advertising campaign for the sale of bird houses at cost, and one asks "What does this manufacturer of roofing obtain by such advertising? While he obtains the same sort of prestige secured by the *Farm Journal* in its bird club advertising, he also has the satisfaction of knowing that he is sampling his roofing, from which the bird boxes are made, to all the individuals purchasing these boxes.

The Bethlehem Steel Company takes space in newspapers not to advertise steel but in an appeal to the citizens of this country for what the company considers fair play in the matter of the government owning munition plants. Wall Street advertises to explain what its business is. In all these cases a specific object animated the campaign, altho at first that object may seem to have little to do with the business of the advertiser.

In these days it is not enough to advertise just for the purpose of selling goods. The merchandising

plan which is the foundation of the advertising must first be carefully studied. This will determine the purpose of the campaign. The principal object of the new concern may be to obtain distribution. The object of the old, well-established concern may be either to secure more dealer cooperation or to create more consumer demand. An advertising campaign without a purpose is like a ship without a destination.

4. *The time required.*—Altho an advertising campaign ordinarily is planned for a year, it should be extended over a sufficient length of time to enable the advertiser reasonably to expect the result desired. Too many advertisers become discouraged just when they are on the point of succeeding.

An advertising agent was asked once how long he thought it would be necessary to test the advantages of advertising for a particular product. Before answering he asked the advertiser, "How often does the same consumer buy your class of products?" He was told the consumer reordered every three to six months. He pointed out to the prospective client that if he advertised continuously for six months and secured all the business in his market, he would then just have a chance to catch each buyer on his next order. In other words, if each buyer were fully convinced by the advertising, six months would only allow each one an opportunity to purchase once. The advertising campaign was started on the six months' basis. At the end of four months the advertiser became discouraged. The agent reminded

his client of his estimate, and asked the privilege of sending a letter to a selected list of the advertiser's prospects. With this letter the agent sent a return postal, on which one of the questions asked was, "How often do you order a product of this kind?" The return postals showed that, while the shortest time was three months, the longest was three years, and the average was eleven and one-quarter months. Other questions asked on the card were: "In what quantities do you order?" and "If you were ordering today, what brand would you specify?" The answers to these two questions indicated a volume of business that would have been equal to a 150 per cent increase in the advertiser's annual business if the buyers had been in a position to order at that time. Yet the advertiser was ready to admit that his advertising campaign was a failure. He had not given the advertising time to show results.

5. *Effect of the campaign on the advertiser.*—When a manufacturer decides seriously to undertake a planned advertising campaign, he immediately changes from the position of letting himself be sold advertising to the position of buying advertising. Undoubtedly the greatest waste in advertising today is indiscriminate purchasing of space and of materials. In many businesses those items of expense which cannot rightly be charged to production or distribution are charged to the advertising department. This department has to bear the burden, for example, of donations and charity which have no direct relation to

advertising, but are charged to it because the advertising account is elastic. When one lays out an advertising campaign, he plans all expenditures, and nothing can creep in that does not definitely bear on his purpose. A campaign is something tangible. The advertiser planning a campaign begins to weigh values. He begins to establish a policy. He sends his order for advertisements in certain mediums unsolicited, because, from the data he has before him, he feels that these mediums will bring him the greatest return on the money invested.

A certain manufacturer spent \$40,000 a year in advertising without any definitely planned campaign. One of the items was \$5,000 for flange signs. The reason he spent \$5,000 was because the price in five thousand lots brought the sign down to one dollar each, while, if he had purchased in one thousand lots, the signs would have cost two dollars each. Altho the signs have been in the manufacturer's possession for over three years, his salesmen have not as yet been able to find five thousand dealers who will use them. Five hundred signs could have been purchased for \$1,250, thus saving the manufacturer \$3,750. Such examples of waste are often found among concerns having no definitely outlined advertising campaigns.

When a manufacturer outlines and attempts to conduct an advertising campaign, he knows exactly where and when he is spending his money. He keeps accurate record of the returns. He begins to have greater faith in advertising as the returns materialize.

He begins to see bigger possibilities in his business. He learns to plan ahead. The concern which definitely lays out and carries forward an advertising campaign has made its first step toward advertising success. The day of profit in hit-or-miss advertising has gone. Without the campaign there is little chance for success.

6. *Effect of the campaign on salesmen.*—The concern which buys its advertising space on the hit-or-miss basis, has no opportunity to inspire its sales force with a realization of what it is doing. Advertising makes it possible for salesmen to close sales quickly. Advertising gives salesmen confidence. A manufacturer who had been buying advertising by the hit-or-miss method determined on a definite campaign for the sale of one of his products, and at a convention at the beginning of the season outlined the campaign to his salesmen. After describing the campaign and the new merchandising plan behind the advertising, he asked each salesman to establish his own quota of sales which he expected to make during the year with the assistance of the advertising. To the manufacturer's surprise and pleasure, the quotas established by the salesmen themselves totaled a 500 per cent increase in his business on the article advertised. That the salesmen were not far wrong in their estimates is indicated by the result at the end of the year, which showed an actual increase of 625 per cent. This example of the power of the campaign on the salesmen is especially interesting when it is realized that the

advertiser spent no more money in the campaign than he had spent the previous year under the hit-or-miss "buy what is presented" method.

7. *Effect of the campaign on dealers.*—One of the first questions a dealer asks a salesman is, "What assurance will I have of consumer demand? Is the article going to be advertised and how?" The old reply, "Oh, my company is spending a large amount of money in advertising," is no longer convincing. Dealers, familiar with the powerful influence of advertising, wish to know the mediums used, the amount of space contracted for, and the quality of the advertisements themselves. Without a definite campaign laid out in advance, salesmen are unable to give dealers this information. And on this ground alone, dealers often refuse to stock the goods.

When the campaign is laid out in advance and dealers are told of the advertising, when and where it will appear, they are in a position to take advantage of the advertising of the manufacturer to call the attention of the public to the fact that they distribute the article advertised. Many dealers are willing to spend their own money to connect their stores as distributing centers with national advertising.

Advertisers often arrange special advertising "drives" for limited periods, keeping dealers informed of the dates of these special efforts in the campaign. During the "drives" increased space may be taken in the national magazines and also on the billboards and in other mediums, in specific localities.

This unusual effort encourages dealers to mention the advertised article in their own newspaper advertisements and to trim their windows with the articles advertised. Advertisers are beginning to learn that they cannot expect much dealer cooperation without definite campaigns planned well in advance, and without giving notice to their dealers of their plans.

8. *Effect of the campaign on consumers.*—The steady, persistent flow of the river wears away the rock. Advertising is powerful, but the power of advertising must be used as the suggestion of a friend, not as the command of a superior officer. Most of us cannot tell what particular influence first induced us to buy any of the advertised products we are now using. Many people use Ivory Soap as a matter of course. They cannot tell what advertisement persuaded them to use it or what advertisement persuaded their parents first to use it. They somehow feel, however, that when they are using it they are using the popular soap, the pure soap, the soap which it is customary to use. The Procter and Gamble Company might stop advertising for a time, and many of us would still continue to use Ivory Soap. It would not be long, however, before the standing which Ivory Soap has in the minds of many people today would be forgotten. A new generation would spring up unfamiliar with the Ivory Soap advertising. Competitors would have been educating this generation to demand their soaps, and in time (in a shorter time

than most of us realize) another soap would probably become the popular favorite.

Popularity of a product cannot be gained by spasmodic advertising. Back of the advertising there must be a plan; there must be a purpose—a unity of purpose. And there must be continuity. The public likes to purchase the popular article. The public likes to know why. The public likes to be constantly reminded. Constant repetition is a great aid to memory.

To the persistent advertiser the public gives that intangible yet supremely valuable asset known as good-will. The good-will of a business is like the character of an individual. Seemingly it may be as firm as the rock of Gibraltar, and yet it may be entirely destroyed in a day. James Pyle's Pearline was advertised persistently from 1877 to 1907. In 1904 the appropriation amounted to \$500,000. In 1907, the last of the Pyle family had died and the business was being conducted by the representatives of two estates. It was felt that Pearline was sufficiently well known to allow the company to discontinue advertising for a few years. The experiment proved fatal. In 1914, the Procter and Gamble Company bought James Pyle's Pearline, thus saving the company, it is said, from actual bankruptcy.

9. *Effect of the campaign on the product.*—When one is in the limelight, he must live up to the reputation created for him, or expect failure more quickly than if he remained in the shadow. Advertising

creates popularity for worthy products only. Advertising will only accelerate the failure of an unworthy product. As soon as a manufacturer puts his name on his product, he feels an added personal responsibility for its quality. Trade-marking and advertising have, perhaps, done more to improve the quality of merchandise than any other influence, not excepting pure food laws and factory regulations.

Mr. Myron McMillan of the J. T. McMillan Company, packers, recalls a case in point. When he first began to advertise Paragon Bacon, he chose street-car cards as a medium so that he might be able to show slices of bacon in the actual colors. He employed a noted artist to paint a picture of his bacon. The proper portion of fat and lean strips made everyone's mouth water. The card had been in the street car but a few days, when, on talking with his superintendent, Mr. McMillan learned that his product did not look like the picture on the street-car card. The superintendent said: "Nobody cuts bacon that way." Mr. McMillan replied: "I advertised this bacon because I thought it was the finest bacon that could be made. Here I find in my own packing house a man who knew how to improve the quality and had not told me of it. The cards are in the street cars, and we must deliver the quality represented. I don't care what it costs; as long as we are advertising this bacon cut to waste, if necessary, but give us the cut represented in the pictures." The new cutting was so popular that it has never been changed to this

day, and the J. T. McMillan Company finds the public is perfectly willing to pay the additional price which allows the packer to cut to waste in order to present the perfect slice.

When the product is once advertised, the wise manufacturer realizes that it must always be kept up to standard and that his success depends on keeping up the quality rather than on taking advantage of a reputation made thru advertising. Improvement in quality gives talking points for advertisements. There is no question that the automobile was brought to perfection more rapidly thru the yearly seeking of manufacturers for new talking points for their advertisements than it would have been if the automobile had not been advertised.

10. *The campaign as a great educator.*—Advertising campaigns have educated the world to the use of the automobile. In twenty years persistent, carefully planned advertising has educated the nation to the use of porcelain bath tubs. Advertising campaigns have explained the uses of new inventions, have described new discoveries, have pictured new methods. In a story entitled: "A World Without Advertising," prepared for the Associated Advertising Clubs of the World, Mr. Forrest Crissey makes the following interesting prophecy:

All these calamities involved in A World Without Advertising are small and scarcely to be considered when compared with the blow that would be dealt to education by such a holocaust of elimination. Aside from the common school

system of the United States advertising is undoubtedly the greatest educational force in existence. Perhaps even this exception is debatable but advertising has no need to claim more than its own in any field and it can do and will gladly do for the common schools for formal education far more than it has ever been asked or permitted to do.

There is in man an impulse for larger living that is the very seed of progress. The individual, the community, the nation in which this impulse is undeveloped, faces certain stagnation. Nothing else stimulates this natural hunger for an expanding experience in every rightful direction as does advertising. Always it prompts man to move forward, to want more things, better things, finer things. It is the official advance agent of Invention, of Science, of Art and of Education.

11. *Advertising and selling expense.*—In the Text on “Marketing Methods” a chapter is devoted to the consideration of the effect of advertising on the selling price of the thing advertised. This is so important a subject, and one which so vitally concerns the future of advertising and the attitude of the public toward all publicity, that it is well here to give additional illustrations of the influence of advertising on prices and to review the arguments which definitely justify advertising as a legitimate, economical, and generally beneficial method of marketing.

The first thing an advertising campaign is expected to accomplish is volume of sales. In obtaining volume the advertiser usually finds that he also decreases his selling cost per unit. Suppose you and a certain competitor are each making annually a million boxes of your products. Assume that you each

have been doing no advertising, but have sold thru salesmen alone, and your salesmen have cost you \$100,000. This is a selling cost for each of you of ten cents a box. You each make a net profit of \$50,000, or five cents a box.

Now suppose your competitor decides to put forth an extra effort to increase his volume and to popularize his brand by advertising. A salesman can take an order for ten dozens just as easily as he can for one-twelfth of a dozen if the demand has been created. One of the purposes of advertising is to create demand.

Suppose that next year, or the year after, your competitor appropriates \$100,000 for advertising, making his total selling expense \$200,000. But in doing this, the advertising so increases his volume of sales that he is able to dispose of 4,000,000 boxes. If it costs him \$200,000 to sell 4,000,000 boxes, his selling cost is now five cents a box, while yours, without advertising is still ten cents. He not only makes four times the gross profit that you make, because he sells four times as much, but he makes another profit of five cents for every box sold, because he can sell a box at half what it cost you to sell one.

How will this affect you? You may not notice the effect while times are good and you and your competitor maintain the same price. But let a crisis come, or let your competitor see that he can increase his volume of business still further by lowering his price to the consumer, and he can practically put you

out of business any time he wants to. He holds you in the hollow of his hand. You are beaten any time he says the word. Thru advertising he has cut his cost to a place where he can make a good profit and still sell at a price below your actual cost.

12. *Campaigns that have cut costs.*—When Hart, Schaffner & Marx began to advertise, the house was doing an annual business of \$1,500,000. Ten years later this had increased to \$15,000,000. An interesting comparison of selling costs and amounts spent for magazine advertising by four ready-to-wear clothing manufacturers was compiled by *Printers' Ink* about the time Hart, Schaffner & Marx reached the fifteen million mark. The selling costs include cost of salesmen only; the percentages are based on total sales.

	<i>Magazine Advertising</i>	<i>Selling Cost</i>
Hart, Schaffner & Marx.....	\$85,000	2½ to 3%
B. Kuppenheimer & Co.....	49,000	4%
Samuel W. Peck & Co.....	29,000	6%
Alfred Benjamin .....	24,000	7%

13. *Experience the best guide.*—Advertising is a subject which is very much alive. It has few traditions, and only a slowly growing body of principles. Two advertising experts may recommend entirely different solutions of the same advertising problem, and both of the solutions may be right. Two campaigns, to accomplish the same thing, have often been conducted in entirely different ways, both proving suc-

cessful. Because of this plastic state of the art of advertising—because the one best campaign for a given advertiser must still be partly a matter of opinion—it is impossible to lay down a set of hard and fast rules for the planning of advertising campaigns. And yet certain general principles have been developed from experience. The advertising world has begun to compare experiences, and to find that in planning a campaign the advertiser or his agent usually asks himself certain fundamental questions which must be adequately answered before any campaign can be properly launched. It is our purpose in the following chapters to outline some of these questions and to tell how the answers to them have affected the results of actual campaigns. We are to give the records of tangible results, rather than the opinions of individuals. The reader will be expected to draw his own conclusions as to how the basic questions should be answered in planning a campaign for the business in which he is most interested.

## REVIEW

Why is a planned campaign preferable to intermittent advertising?

What are some of the things to be done in obtaining unity in an advertising campaign?

What effect does volume of sales have on selling expense? What is the relation of advertising to volume and expense?

Do people like to buy advertised goods? Why?

Why is it dangerous to advertise a product unless it is of high and stable quality?

Can you think of any commodity besides automobiles which has been perfected largely because of advertising?

## CHAPTER II

### ANALYSIS OF POSSIBLE DEMAND

1. *The necessity of preliminary investigation.*—Advertising is expensive, and a considerable length of time must be consumed before returns can reasonably be expected from the investment. An advertiser must have definite knowledge, therefore, of the conditions of the market as they may affect his sales and definite knowledge of what he hopes to accomplish before he begins to spend his money. Not so very long ago advertising was looked on largely as a gamble, and few if any preliminary investigations were undertaken before campaigns were launched. Even today we hear stories of newspaper advertising campaigns to sell electric flatirons and electric toasters, conducted in a great number of cities, some of which are not equipped with electric power plants, and in which, therefore, no sales of electrical appliances could possibly be made.

2. *A well-planned campaign.*—In a previous Text the Crisco campaign was mentioned as one admirably illustrating the results of careful investigation. There is a lesson for every advertiser in the details of this spectacular success. When the Procter & Gam-

ble Company put Crisco on the market in January, 1912, the campaign was launched only after two years of testing the product, investigating the market, and trying out various ways of reaching the market. Here was a great organization, capitalized at \$15,000,000, with an enviable record of success in advertising soaps, familiar with the grocery trade, and in a position, one would think, to know exactly how to advertise any product going to the same class of people that used its other products. Nevertheless, the Procter & Gamble Company was not conceited enough to think that it could afford to enter on a new venture without a careful preliminary investigation. The first year was spent in tests in cooking schools, in laboratories, and in every conceivable place where Crisco might be used to advantage, to determine its value and uses. Nearly the whole year 1911 was consumed in conducting test selling campaigns in different territories in order to discover the most profitable plan of selling and advertising. In all, six different sales promotion plans were tried out in various parts of the country before any plan of action was adopted as a standard for the national campaign. Ten thousand dollars are said to have been spent in one test alone.

The value of this long period of planning and of trying-out is clearly indicated by the fact that Crisco is today an assured success, outselling all of its competitors in spite of the fact that substitutes for lard and butter in cooking had been on the market for

more than a quarter of a century before Crisco first made its appearance.

3. *The importance of tests.*—The modern advertiser is beginning to learn from the chemist that time and money are saved by testing the sample and learning just what the sample consists of and just what may be expected of it, before proceeding with the entire quantity. He is learning from physics that a cross-section of any object will give an accurate guide to the body of the object. He is learning from the science of statistics that, while no man knows the exact moment of his death, the death rate of almost any city in America can be prophesied to within five persons in every thousand from year to year. While one cannot tell in advance accurately how much business to expect or what particular kind of advertising appeal may influence each individual, he can make a fairly accurate estimate of total business and of the most profitable appeal, from the results of tests conducted on a sufficient number of people.

If one were to ask what is *the* important part of any advertising campaign, the answer of the most thoughtful advertising men would undoubtedly be, "A thoro knowledge of all conditions." And a thoro knowledge of all conditions can be obtained only by careful preliminary investigation.

4. *Relation between advertising and selling investigations.*—Before a manufacturer decides to try to market a product he should carefully investigate demand, test his goods, study competition, and ask and

answer a hundred questions that will help him in determining the possibilities of success or failure. Then, after he has decided to launch a campaign, additional investigations are necessary to enable him properly to select trade channels and to plan the details of his sales and advertising campaigns. These details are dependent on all of the things the manufacturer has found out about his product, his market and the ways of reaching the market. In the Text on "Marketing Methods" the questions to be asked in advance of the opening of any selling campaign are considered in their relation to the plan behind the personal salesmanship and the advertising—to those preliminary problems that must be solved before the manufacturer decides to use either personal salesmanship or advertising, or both, to market his goods. In this chapter and the one following, many of the same questions are considered, but specifically in relation to their effect on the details of the advertising campaign.

It should be remembered that personal salesmanship and advertising are but two different ways of doing the same thing, and that before either one is attempted, the man with something to sell must find out many things. Everything that he finds out has a bearing on everything that he does later to accomplish his purpose. In the present Text we are concerned only incidentally, for the purposes of review, with the way in which investigations aid a man in deciding whether or not to launch a campaign at

all; chiefly we are concerned with the way in which they help him in preparing the thousand details of the campaign that revolves around the appeal of advertising.

5. *Developing demand*.—One of the first questions to be asked in planning an advertising campaign is, “Is this a product with which the public is now familiar, or must people be educated to the use of it?”

If the article to be advertised is entirely new, the advertiser must undergo the expense of an educational campaign. On the other hand, if the public is already familiar with something similar to the new article, the great expense of an educational campaign may not be called for, but the advertiser has immediately to face the serious element of competition, and the fact that the public is already using a similar product which can, perhaps, be displaced in popular favor only with the greatest difficulty.

6. *Time required to develop demand*.—Before the days of the cash register, the adding and the talking machines, business houses were handling cash, keeping books and writing letters. All three of these inventions completely revolutionized their fields. Tho competition soon sprang up, the principal problem of the manufacturers of these machines was that of educating the business man to change from the old way to the new way. It is not enough simply to discover a new and a better way. Much time and money are usually required before the new way is accepted by the public.

As far back as 1890, Thomas A. Edison invented the phonograph, and the newspapers of that day carried his statement of the advantages which would result from this discovery. He laid particular stress on its possible use in business correspondence. Yet it was not until twenty years later, when the Dictaphone Company undertook a carefully laid out advertising campaign to educate the American business man to the use of the talking machine, that any considerable demand was developed for it in business offices.

When the Thermos bottle was introduced by William B. Walker in 1907, there was, of course, no developed demand. A carefully planned educational campaign of advertising was conducted; yet it was not until the beginning of 1913 that any appreciable demand for Thermos bottles was developed among mechanics for use with their dinner pails—the class of demand which will probably be the greatest, and the use which would appear to the outsider as the most evident.

The difference between satisfying a developed and an undeveloped demand is well illustrated by comparing the Thermos campaign with a safety razor campaign. In the latter part of 1912, William B. Walker put the Mark Cross safety razor on the market. With the aid of a *developed demand*, a well-planned advertising campaign, and a startlingly low price, the sale of Mark Cross razors in New York City alone amounted to over 98,000 the first day the

advertisement appeared. The sale for the first three days in New England and New York State reached the astounding figure of 2,000,000.

7. *Influence of price.*—It must be borne in mind that a low price greatly assists, and a high price often retards, the development of demand. There were enough Thermos bottles sold to automobilists and others at \$7.50 to \$12.50 to keep the American Thermos Bottle Company running at full capacity, but it was not until the price reached \$1 to \$2.50 that the demand of the laboring classes began to be felt. Mr. Walker's own words in relation to how quickly the demand was created thru advertising are interesting. He says: "New manufacturing concerns usually spend \$200,000 or \$300,000 and wait three or four years to establish a demand for their product and see their money coming back. From the moment we took six full-page spreads in the New York City papers, to tell about the Thermos bottle, we have never caught up with the demand."

8. *The repeat element.*—The Mark Cross razor is seldom found on the market today. Because of the startlingly low price, entering into a field of developed demand, its success was phenomenal in the beginning. But the advertiser had evidently overlooked one very important element in the planning of any advertising campaign. This is the element of "repeat." An advertiser may apparently be successful in the beginning; but with many products one sale does not naturally lead to another, and, if the same

customer does not come back and purchase again, one of two things will happen. Either the time will arrive when every possible customer has been sold and no new sales can be made, or, after the early advertising has done its work and publicity is discontinued, sales will stop because the many non-users of the product have not been influenced to buy it. The Mark Cross razor was well advertised and largely sold. Presumably many of the original purchasers are still using their razors, and there is no reason why they should purchase again. The discontinuing of the advertising lost to the manufacturer the opportunity to make sales to the millions of people who were not reached by the early publicity.

In estimating the yearly demand for your product it is important to determine whether, and how soon, a satisfied customer should come back for more. Is your product of such a nature that but one sale can be made to a customer in the customer's lifetime; or will that customer buy once a year, once a month or once each week?

Unless you had carefully studied your problem in advance, you might get well under way in your advertising and suddenly discover that you had sold every person in your market who cared to buy, and that to sell more you would be compelled to wait for a new generation. It often costs more than the selling price to gain the confidence of a customer. The profit in most businesses is in the reorder. The business which finds itself in the position of

having a new market of already-convinced customers every six months has a great advantage over the one that must wait a year or longer for repeat orders.

9. *Turning a single demand into a repeat demand.*  
—It is often possible thru a little ingenuity to change a one-time seller into an active repeater. We can all remember the razors our fathers used to prize. They not only lasted a lifetime but were known to improve with age. The razor your father prized the most was the sacred one that you, as a boy, were never allowed to touch—only to look at with wonder and admiration. It had been your grandfather's razor. You were told that some day it would be yours. The cutlery business was then centered around Sheffield, England. It was said to be very profitable. The population of the world increased so fast the demand for razors seemed always to be growing. It probably never occurred to the steel barons of Sheffield that anyone could tell them anything about the razor business. Yet along came a Yankee who separated the blade from the stock, called the attention of the world to the time it was wasting every morning in stropping, and, instead of selling a razor at \$2.50 or \$3 which would last for generations, he succeeded in securing \$5 on each first sale and a dollar for the new blades every six months or so thereafter for the rest of the lives of the men who responded to his cleverness.

There are fortunes still awaiting the men who are

clever enough to increase the element of "repeat" in any business.

While in the case of some articles of high price, such as machinery for manufacturing establishments, a business can be conducted profitably without any appreciable element of "repeat," an article of low price and of constant consumption, such as food or clothing, could seldom be successfully marketed if it is found not to be a steady repeater.

10. *Testing "repeat" in advance.*—Some advertisers have developed ingenious ways to test the element of "repeat" in a product before extensive advertising is undertaken. A manufacturer of collars recently went into the business of making handkerchiefs. Without any advertising the salesmen in selected territories were instructed to give away a certain number of the new handkerchiefs at business men's clubs and other gatherings. The number of original samples distributed was recorded for each district, and the resulting sales were carefully tabulated. As this was done in all parts of the country, an interesting average of the primary element of "repeat" was obtained.

Another way to test the "repeat" of an article is to get a list of purchasers with dates of purchase and to send them a letter with a stamped return card asking if they are still using the article, and how many times, to the best of their memory, they have re-ordered.

Altho some things can be made to repeat by educa-

tional advertising, others are stubborn non-repeaters, and the advertising campaign must be carefully planned with that fact in mind. Some manufacturers believe that their products possess the element of "repeat," only to find, after tests have been made, that the articles are regarded by the public as mere novelties, which will not be purchased twice by the same customer.

11. *The family of products.*—Some advertisers find that the taste of the public for their particular class of products is so changeable that they are forced to take advantage of the element of "repeat" thru what is known as "the family of products" idea. After a reputation for one product has been established, it is easier to create a demand for another product under the same family name than to commence from the beginning and attempt to establish a demand for an entirely new product and make a reputation for it. For example, Quaker Oats, Quaker Puffed Rice and Quaker Puffed Wheat form a well-known family of products. The manufacturer of a group of products of common characteristics bound together by a common name can offset the lack of "repeat" in the individual members of his line by the demand he can create for others. One of the arguments for the Rubberset shaving brush is that it will last almost a lifetime. Yet, after a reputation had been established for this method of making brushes, the manufacturer made many of his satisfied customers come back again, not for shaving

brushes, but for tooth brushes and other brushes of his make.

12. *The element of seasons.*—There may be certain times of the year in which the demand for an article is greatest. There may be other times in which there is no sale for it. The manufacturer may or may not be able to overcome this condition. Many manufacturers are using advertising in an attempt to do what electricians call “superimposing the peak upon the valley.” That is, they are trying to raise the sale in the dull season and to lower it, if necessary, in the good season, to make a more even output the year round. You can’t sell ice skates in the summer, but you can make ice skates and roller skates in the same factory.

13. *How to study seasonal demand.*—Most advertisers realize how much the climate and the weather affect sales, but few seem to know how to take advantage of these conditions and plan for them in advance. The facilities of the United States Weather Bureau are at the disposal of those advertisers who know how to take advantage of them. Most advertising managers of department stores keep in close touch with the weather reports. Bakers are said to rely upon them to determine each day the amount of bread that will be consumed. If the day is to be cold or rainy, a proportion of housewives will probably bake their own bread. If it is to be hot, they may not care to make the exertion, and, if it is to be a beautiful, sunny day, they will probably prepare to

go calling or shopping. After years of experience bakers are said to gauge accurately the day's demand in this way.

Suppose you were selling ice skates, furs, mufflers, sleds, sleigh-bells, sun helmets, fans, seeds or bulbs. A careful study of climatic conditions will show you the centers of your most natural markets. If your product happens to be rubbers, rubber coats or umbrellas, a study of the average rainfall in different sections may assist in determining your most profitable markets.

If you are selling straw hats, underwear or awnings, climatic conditions and unswerving customs will arbitrarily fix your seasons for you, and you must time your advertising accordingly. It must be borne in mind that seasons come much earlier in some parts of the country than in others. Spring clothing is sold in New Orleans during February, while in Duluth May is often early for its sale. There are two seasons for selling underwear. The summer season commences in some sections as early as May and rarely lasts longer than eight weeks. The winter season commences in November and rarely lasts longer than six weeks. The advertising of these goods is timed to commence about a month in advance of each selling season.

The season for wearing straw hats is supposed to commence in most localities on June first and to end on September first. The best part of the buying season is over, however, about three weeks after the

first of June, and lucky indeed is the dealer who by cutting prices many times is able to dispose of the remaining stock to those whose hats wear out before September first. If you were advertising straw hats, you would probably want your advertisements ready and in the hands of the local newspapers by the first of May.

14. *Dealers' and consumers' seasons.*—For those who sell thru dealers there are, of course, two classes of seasons, the dealers' season and the consumers' season. With some products, automobiles, for example, these seasons are practically the same. With others, such as wearing apparel, there may be six months between the time the dealers order and the actual sale to consumers. The advertising man knows this and plans accordingly. He usually prepares his "dealer literature" and his "consumer literature" for one year's campaign at the same time so that he may show the dealer reproductions of the consumer literature which is to appear later. In these days the dealer, after satisfying himself as to the quality of, and the profit on the goods, next wishes to satisfy himself as to quality and the quantity of the advertising which will assist in creating a demand.

15. *Staples and novelties.*—One of the causes for the failure of advertising campaigns is that some advertisers have not clearly distinguished the difference between staples and novelties. Many advertisers cannot forget the story of the man who made a fortune by inventing a game called "Pigs-in-clover." They

do not stop to ask themselves how much they would be willing to pay for stock in his company today.

The American people are said to be novelty crazy. Fortunes have been made by catching the public fancy. Thru the influence of a tremendous amount of advertising a demand for a novelty can be created. Yet the manufacture and sale of a novelty, requiring a heavy investment either in machinery or advertising, is a hazardous business in which to engage. If you wish permanently to engage in a business built on public fancy, two things are essential: (1) that you have in readiness some other novelty which you can produce with the same organization; (2) that you prepare yourself to "get out from under" when the fickle fancy of the public begins to change.

Mr. Joseph Strong, of Strong and Warner, milliners, is interested in nearly fifty retail millinery stores situated in different parts of the United States. He himself superintends from his office in St. Paul, the advertising in each of these stores. The millinery business is built entirely on the fleeting fancy of Her Royal Highness, the Lady-of-Fashion. The hat is a necessity, to be sure, but the particular shape and color of hat that her ladyship will wear depend entirely on her taste or the season's styles. Milliners spend thousands of dollars to determine in advance what the season's demands will be, but there are always some shapes and colors which do not sell as well as others, and, despite Dame Fashion's rigid dictates, tastes seem to vary in different localities. Mr. Strong re-

ceives daily reports on chart sheets from each of his stores showing how each of the season's shapes is selling in each color at each price.

When the season is advancing and he sees that in certain cities certain shapes and certain colors at certain prices are not selling, he draws a line across his chart of shapes and colors, running it up and down with the prices, and announces that all hats falling in the chart below the line shall sell at a given reduced price, while all those above the line shall remain at their former prices. For example: all purple hats of shape No. 1 selling as high as \$12, all black hats of the same shape selling as high as \$10, all purple hats of shape No. 2 selling as high as \$9, and all white hats of shape No. 2 selling at \$6, shall sell at \$5 until further notice. If a week goes by and still there are hats which do not move fast enough, he may draw another line still higher up on the price scale and offer still higher priced hats for \$5, or he may use the same line and cut to \$4. In making these cuts he never regards the original manufacturing cost; he bases his prices only on demand, knowing full well that a novelty out of season has practically no selling value.

16. *Necessities, luxuries and conveniences.*—Staple articles may be divided into three general classes, and advertising campaigns must be conducted with this differentiation clearly in mind. These general classes are: necessities, luxuries and conveniences. The demand for necessities is universal, while

the demand for luxuries must always be limited by the purchasing power of the individual. We eat up today the food we bought yesterday. We wear out the clothing and we consume the fuel we bought a few months ago. Necessity demands that to sustain life and to exist in comfort, we must come back for more. Altho, as civilization advances, it is hard to distinguish the luxuries of yesterday from the necessities of today, generally speaking, necessities include chiefly the things required for food, clothing and shelter. The amount of demand for a product will depend partly upon which group it falls into, necessities, luxuries or conveniences.

The great impetus which advertising has gained in the last half century is in part due to the fact that instead of using the influence of publicity, chiefly to sell patent medicines, fortune tellers' aids and such things which are far from being necessities, it is now used to sell food, shelter and clothing.

17. *Making an article a necessity.*—Between luxuries and necessities there is another group of things, in which are included, perhaps, the majority of our purchases. They may be called conveniences. A suit of clothes that will protect the wearer from the weather and suitably cover the body may be bought for eight dollars. Such a suit is a necessity. The average price paid for ready-made suits, however, is said to be between twenty and twenty-five dollars. The man who pays this much is scarcely buying a luxury, and yet he is paying more than the strictest

necessity demands. A twenty-five dollar suit is a convenience for a multitude of men.

It is within the power of advertising to educate the public to regard as conveniences those things which it has previously regarded as luxuries, and then later to make the conveniences necessities. A bath is a necessity. A bath tub makes the taking of a bath convenient, and it is, therefore, a convenience. A quarter of a century ago a porcelain bath tub was a luxury in the American home. But the porcelain bath tub was so much more convenient than the old English tin foot tub that after people had once used it, they would not be without it. Now we have almost forgotten the old tin tub, and, if we should be forced to return to it, we should feel that we had been deprived of one of the necessities of life.

The Chalmers Automobile Company for several years conducted an advertising campaign the prime object of which was to take the automobile out of the class of luxuries and to put it into the class of conveniences or necessities. The advertising featured the convenience of the automobile to the doctor who by its use was able to make his calls quickly, and its necessity in those cases in which a life was to be saved and a horse would be too slow. It showed how the automobile enabled the business man to make more money, and the family to get out into the healthy open. It pictured the automobile as a necessary contributor to long life, wealth and happiness.

Thru an analysis of the possibilities of the demand

for their products advertisers have not only developed their business but have taught the world to be dissatisfied with anything but the highest planes of living.

18. *Estimating possible demand.*—The manufacturer of necessities finds many government and state bureaus ready to help him in estimating the possible demand for his product. As early as 1800, the United States government began to compile records of the annual consumption of many articles of food and clothing. By dividing the total amount consumed in the United States by the population of the United States, one may obtain an estimate of the per capita consumption. By multiplying the amount consumed by each person by the number of people in a particular sales district, the manufacturer may learn approximately the amount of his class of product which is consumed annually in his trade territory.

The next problem is to find out how many other manufacturers are satisfying this demand and the probable proportion of the business which he, with his product, may be able to control. While it must be understood that the estimated share of the demand which a manufacturer may be able to center on his product is very indefinite, such an estimate, based on available records, is at least a step in advance of the reasoning of Mark Twain's Colonel Sellers who estimated the fortune he would obtain from his new eye-wash purely on the basis of population multiplied by

two, as each person was supposed to have two eyes for the use of the product.

The statistical departments of some large manufacturing establishments thru estimates obtained over a period of years are actually able to furnish calculations within five per cent of the amount of their product which, with a certain sales plan and advertising appropriation, can be sold in any new territory.

Mr. R. S. Patrick of Duluth, Minnesota, sells diamonds for use in drilling holes in mining explorations. He has worked out a plan of gathering statistics whereby he can tell from month to month, from estimates of the number of drills in operation in different ore districts and the average wear of diamonds per foot drilled, the number of carats of new diamonds that will be needed and the proportion of these which his salesmen should be expected to sell. All his advertising is done direct by mail because of the limit of his field. He has records of the returns that his advertising brings, and is always in a position to estimate the possible demand from any particular ore field. If this can be done in the field of mining engineering, where new operations are usually undertaken with extreme secrecy, there is no question of the possibilities of analysis in relation to a great many other products. Tendencies indicate that before many decades have passed the majority of successful manufacturers will be employing scientific methods in estimating the possible demand for their goods.

19. *Consumption estimates.*—Estimates of annual

per capita consumption in the United States are hard to obtain. The following list has been compiled from many different sources. While it is comparatively short, it is probably the longest that has ever been printed. Some of the figures represent consumption in pounds or bushels, others in units of the commodity, and still others represent expenditure in dollars.

<i>Commodity</i>	<i>Consumption per capita</i>	<i>Commodity</i>	<i>Expenditure per capita</i>
Beef, fresh	73.1 lbs.	Books and papers	\$2.05
Beef, salt	11.5 lbs.	Clothing, children's	
Bread	52.7 loaves	(per child under 10)	3.05
Butter	24.4 lbs.	Clothing, men's	
Cheese	3.3 lbs.	(per adult male)	27.77
Cigarettes	124.6 cigarettes	Clothing, women's	
Cocoa	1.25 lbs.	(per adult woman)	20.37
Coffee	11.0 lbs.	Crackers	1.00
Corn	27.3 bu.	Diamonds	0.43
Cotton	20.0 lbs.	Fruit	4.26
Eggs	17.7 doz.	Fuel	8.01
Fish	16.6 lbs.	Furniture	8.33
Flour and meal	142.13 lbs.	Insurance, life	6.67
Lard	17.5 lbs.	Liquors, alcoholic	21.85
Liquors—malt	19.75 gals.	Lighting	2.03
Milk	74.1 qts.	Shoes	8.44
Molasses	0.75 gals.	Soda water	1.20
Meat (other than beef and pork)	16.2 lbs.	Works of art	1.21
Pork, fresh	23.7 lbs.		
Pork, salt	23.1 lbs.		
Potatoes	3.1 bu.		
Poultry	14.1 lbs.		
Rice	5.24 lbs.		
Sugar	79.9 lbs.		
Tobacco	5.7 lbs.		
Underwear	3.6 suits		
Whiskey and rum	1.4 gals.		
Wheat	6.48 bu.		
Wool	5.25 lbs.		

In estimating per capita consumption, one must remember that the demand may vary considerably from year to year. Even in articles apparently as

staple as tea and sugar there is a constant variation dependent on many conditions. During the last forty years the per capita consumption of sugar has increased 108 per cent, while the per capita consumption of tea has decreased thirty-eight per cent.

20. *Methods of estimating.*—There are many ingenious ways of estimating total possible consumption. Most of them depend on taking a certain quantity which is known and from it estimating the unknown. For instance, you may be able to find out how many containers, such as cans and bags, are sold in a particular territory to manufacturers, and, from this, estimate the sale in pounds of the products for which these bags are used.

21. *Testing a demand in advance.*—There are certain lines of business which in the beginning may seem to be profitable and to warrant extensive advertising campaigns, but which on further investigation prove to be absolutely without a stable demand. This is particularly noticeable in the publishing business. One publisher estimates that during the last fifteen years as many as a dozen different publishing houses have spent an aggregate of over half a million dollars in attempting to sell sets of books on agriculture. In one case, an advertising campaign in excess of \$50,000 was undertaken. Each of these twelve attempts is said to have been unprofitable.

It is said to be no uncommon thing among publishers of books of a technical nature to send out a few thousand letters soliciting orders for a book before

a line of the book is written. If the demand is not sufficient, the book is not prepared. Whether the book is to be printed or not, the money is always immediately returned with a note that the publication has been delayed (or indefinitely postponed, as the case may be) and that the subscriber will be notified when the book is off the presses. This is one way to test a demand in advance, and has often saved considerable money.

### REVIEW

Under what conditions are "educational," and under what conditions are "competitive" campaigns called for?

Devise a method of testing "repeat" in advance, which would be applicable to some business with which you are familiar.

Has anything which you formerly considered a luxury become a necessity to you thru the educational power of advertising?

What should be the prime object of an advertising campaign for a luxury?

What helpful facts, if any, about your own business could be learned from a study of per capita consumption? How could these facts be used to increase sales?

How much coffee does your city consume annually?

## CHAPTER III

### ANALYSIS OF COMPETITION

1. *Competitive tendencies.*—Before a manufacturer starts to advertise, he should consider carefully competition. Competition must always be met even by the manufacturer who fancies he is protected by a patent. The advertising of a patented article must fight two kinds of competition: first, competition of the old article or method which the new invention is designed to supplant; second, competition of imitators who are sure to appear on the scene.

When the Dayton Engineering Laboratories Company produced the self-starter for automobiles, its first competition was with the old cranking method. The second class of competition soon appeared, and within a year there were over fifty other organizations claiming original patents and manufacturing self-starters.

Until recently competition was thought to be the mother of advertising. The man with few or no competitors said: "Why advertise when I get all the business, anyway?" This was in the days when advertising was used purely as a competitive weapon, before the educational power of publicity had begun to be appreciated. Now, many business houses that

seemingly have monopoly of their respective fields, spend large sums in advertising, partly to increase the use of their goods or service, partly to create good-will for themselves and their products, and partly to forestall the advertising of competitors who may appear in any line. The best kind of advertising is that which is constructive and educational rather than that which is purely competitive.

2. *Imitation of competitors undesirable.*—Some advertisers do nothing but copy their competitors. This policy seems to be just as disastrous as the policy of not considering competition at all. It is difficult to obtain reliable information in regard to one's competitors. Most of the so-called information is mere gossip. There is a vast difference between spending one's time gossiping about one's competitors and spending one's money to prepare careful estimates and to obtain reliable information about them.

Too many manufacturers are prone to sweep aside the question of competition with the egotistical assertion, "We have no competitors." The fact that a concern may make an article of inferior quality to yours, or at a different price, is no proof that it does not compete with you in the market.

3. *Comparison of quality.*—The man who advertises should know exactly the advantages or disadvantages he has with respect to each of his competitors. He should analyze the quality of his product and the products of his competitors point by point and piece by piece.

A manufacturer of candies obtains all the different brands of his competitors, and assembles them in little groups on a table without the boxes or other features which might indicate their origin. He then has his tasters test the quality. Next, his chemists analyze the ingredients. He studies the shape of each chocolate cream from the standpoint of appearance. In each test the different products are graded and a relative value is given for each test. He also makes a test of the appearance of the package and the appearance of the labels, attempting to come to an unbiased decision. If these tests do not show his products to be superior in every particular, he sets his manufacturing department to work to obtain superiority. He does not leave competition to guess work.

4. *Making the product attractive.*—A customer will perceive your article thru his or her senses. The more attractive it is to any of his senses, the easier will be your sale. With such conditions as food and toilet articles, which have an intimate relation to the body, the more senses to which they can be made to appeal, the greater will be the manufacturer's competitive advantages.

There are many bath powders on the market. The principal advantage to be obtained from a bath powder is its property of softening the water. The raw material from which bath powders are made is not particularly attractive to the sight. The manufacturer whose chemist has found a way of putting his bath powder up in white crystals or as a soft, white

powder which is attractive both to sight and to touch, has an advantage over his competitors. The raw material is odorless. The manufacturer who has perfumed his finished product obtains a still greater advantage over competitors. The reaction of the crystals in the water is ordinarily not visible to the naked eye. The manufacturer who has succeeded in making the perfumed crystals effervesce when they enter the water, has added another appeal to the senses. Thru the study of the senses this manufacturer has so improved his product from the standpoint of its acceptance by the consumer that one can apparently feel, see, smell and hear the powder as it does its interesting work.

The more attractive the design of the product or its container, the greater is its competitive strength. Some years before the outbreak of the European war, the British government took official notice of the fact that articles of German manufacture were making great headway in England. A commission was appointed to investigate German merchandise, its manufacture and distribution, and to determine, if possible, why German goods were being largely sold in Great Britain. After an exhaustive investigation, the committee reported that neither the materials nor the workmanship of the Germans was superior to the British, nor were the Germans able to sell at so low prices as their English competitors; the important fact was brought out, however, that the designs of German merchandise and the packages in which it

was sold were so superior that the articles themselves were more attractive to the British and *seemed to be worth more* than those of English manufacture.

5. *Comparison of good-will.*—The next step in the analysis of competition is the amount of advertising which each competitor has done and the amount of good-will which each has obtained thru his advertising and thru the satisfaction which his products have given.

A manufacturer whose plant is estimated to be worth about two million dollars recently remarked: "If I were forced to choose between sacrificing my plant and the good-will which this company has established thru continuous advertising for the last twenty years, I should willingly say, 'Burn down the plant. I can obtain capital to rebuild it tomorrow, because our advertising has created a demand which has a bankable value and will bring new capital.' This is our strongest bulwark against competition. A new plant can be built in ninety days. But our advertising has taken years, and no amount of capital could substitute for the impression it has made." It is important, therefore, that the advertiser determine how long each competitor has been established and how long each has been advertising continuously.

Merely a list of the advertising schedules of one's competitors, however, will not necessarily provide basis for an estimate of the good-will each enjoys. One should learn of the friendships which competitors

have established with the trade and with consumers, together with the methods employed to obtain these friendships. Only in this way can the new advertiser intelligently lay plans for the building up of good-will for his own name and for his own products.

6. *Comparison of advertising.*—It is well to have a scrap-book and to keep in it copies of the advertisements of competitors. There is no particular advantage in referring to it daily, but, at the end of the year, by comparing it with the records of your own sales and those of your competitors you will have a basis for judging the value of competing advertising which is far better than mere opinion or hearsay.

In planning a campaign it is always advisable to list the publications in which each competitor has advertised and to find out how much each publication has been used. In active competition a manufacturer always tries to reach the same buyers that his competitors are reaching. Do not jump at the conclusion, however, that just because a competitor is using certain publications his investment is proving profitable. An advertising agency recently planned a national campaign for a manufacturer who at first insisted on using every medium his principal competitor was using. The agent found that in many publications the competitor had contracts for but one insertion, and, from the nature of the product and the medium, the agent was certain the competitor lost money. On more thoro investigation, the agent found that the competitor was simply a plunger and that he had no

plans or records to guide him in his advertising. He found, however, that another, a much younger and smaller competitor, kept very careful records of returns. The advertising schedule of the small competitor proved to be a much better guide for the new advertiser than the list of mediums used by the larger and more important manufacturer.

A large western paint house recently decided to advertise in farm journals. It wanted to dominate the field. Fourteen competitors had been using farm journals for many years. The paint manufacturer asked his advertising agent to obtain for him schedules of the advertising of all his competitors for the five years previous. These schedules showed that all the competitors began to advertise in the first weeks of February. The manufacturer for whom the investigation was made decided to commence his advertising one week earlier, so that he would be the first whose advertising would be noticed in the farm publications. He also made his advertisements a little larger in size than those of any of his competitors. By making a careful investigation and by doing the things to which a study of competing advertising logically pointed, he was able to dominate his field from the beginning.

7. *Studying a competitor's follow-up.*—A common method of keeping track of competitive advertising consists simply in responding to a competitor's advertising and in keeping accurate record of the way in which the competitor answers and follows up

the inquiry. The inquiry is usually made in the name of someone who might be considered a possible purchaser. As each letter or piece of literature comes in, it is dated and compared for appearance, quality and the impression it creates with other literature received from other competitors. By this method an advertiser is able to learn the following facts in relation to competition:

- a. How promptly inquiries are answered.
- b. How many pieces of literature are sent to each prospect.
- c. The quality of letters used—whether all inquiries are answered with personal letters, multigraphed letters or printed literature.
- d. The cost of a competitor's follow-up. This can be roughly estimated by adding the cost of postage to the probable cost of the letters and the other advertising literature that is received.
- e. The relative emphasis given to each sales argument. This is an interesting test. A complete set of each competitor's literature is taken and the sales arguments of each listed. Then a record is made of the proportion of space used for each argument and the order in which the arguments are introduced. Such a test often reveals some most valuable facts.
- f. How completely the sales organization cooperates with the advertising department.

8. *Correcting errors by studying competitors.*—A manufacturer of trucks wanted to know the sales and advertising methods used by his competitors. He

found that while he was using form letters to answer inquiries, twelve of his fourteen competitors were using personal letters and referring in these letters to trucks they had sold to buyers located in the city or district from which the inquiry came. This led to his keeping an accurate record and a set of testimonial letters for every truck he sold. He found that eight of the fourteen competitors spent a dollar and a half on each inquirer in letters and booklets. The most striking discovery was made in studying the dates on which the different pieces of literature were received and the promptness with which the district representatives of his competitors called on the inquirer. Twelve of the fourteen competitors sent a sales representative to call on the inquirer before he received or could have received a letter from the manufacturer in reply to his inquiry. This clearly indicated that these twelve manufacturers did not wait for the mails, but were in the habit of wiring their district agents on receipt of inquiries from responsible persons. The manufacturer who conducted the investigation had not been doing this. He had been losing considerable business in his own territory, but until he made this analysis he could not understand why.

9. *Comparison of sales policies.*—Advertising, the putting of one's sales arguments on paper, has probably had more to do with developing sales policies and the ideals of business than any other force. A non-advertiser usually follows the crowd. But as soon as advertising is undertaken, definite sales poli-

cies must be chosen and adhered to. Many advertising campaigns have had for their purposes the remedying of some particular sales conditions.

One manufacturer has a competitor who is in the habit of overselling. It might seem that to avoid substitution by dealers, the only way to meet such competition would be to oversell also. But the sales manager, realizing the weapon he would have by pursuing a different policy, instructs his men to undersell rather than oversell, and to make a talking point of it. The advertising man, seeing his advantage, calls the attention of the public to the fact that his goods in the dealers' hands are always fresh; and the policy of competitors is thus made to pay handsome returns.

10. *Quality arguments versus price appeal.*—There never has been a more vivid illustration of fierce competition than that furnished by the condition which existed in the flour business at the beginning of the twentieth century. Ten thousand millers were crying, each with a loud voice, that their product was "the best, the best, the best." And yet each was competing on the same basis with all the others—cutting prices and lowering quality. In this condition the larger mills, being able to buy wheat at the lowest prices in the world's market, had a great advantage over the smaller mills which, located in small towns and forced to grind the high-grade local wheat, found hardly enough profit in the business to make a decent living.

One of these small town milling companies was the Russell-Miller Milling Company. In the spring of 1902, this company owned one little mill of only 225 barrels daily capacity, located at Valley City, North Dakota. In the spring of 1905, the Russell-Miller Milling Company opened an office in Minneapolis. It was not an unusual thing in those days for a small town mill, thoroly convinced of the superiority of its product and with a faith in the discretion of the public, to establish a Minneapolis office and begin to raise its little voice and cry "the best, the best," with the rest. The results were usually the same. It was usually not long before the impudent little aspirant was caught in the maelstrom of competition, and all its breath was used up in hard swimming.

Everybody predicted the same thing for the idealists from North Dakota. One grain man said at the time: "Oh, they won't last long. They'll make a little noise and spend a lot of good money in advertising, but as soon as the big boys find these fellows the least bit bothersome, they will cut prices below cost if necessary, and smother them."

But the Russell-Miller Milling Company had studied the sales policies of its competitors and had determined on a plan of advertising which would disarm them. On a given day advertisements appeared simultaneously in the Minneapolis street cars, on the billboards, in the newspapers and in the grocers' windows. Instead of the old phrase—"best on earth," and the like—there appeared the bold

declaration, "Occident Flour—costs more—worth it." Simple as it was, the fact that quality is more important than price seemed to be a new idea in the milling business.

Straightforward advertising with quality behind it has often cut the Gordian knot of price.

11. *Comparison of territories covered.*—In planning advertising campaigns, one should know the most profitable territories in which to advertise. A map showing the location of each competitor and relatively the territory each covers, usually discloses interesting and valuable facts. Such a map should be compared with a map showing the probable consumption of the commodity. This map can be made from records of per capita consumption and other estimates.

Some territories are often overcrowded with competition, while others, fully as productive, present very little competition. Manufacturers who keep their eyes too closely on competition and do not regard it in the broadest way are apt to scatter their efforts by jumping here and there on rumors that competitors are starting advertising campaigns in certain territories. A knowledge of the probable consumption in any territory will help a manufacturer to determine whether his competitors' efforts are likely to be successful and whether it is advisable for him to make an extra effort to combat the competition.

In the distribution of most staple articles, competition is divided into two classes. There are the

large competitors who cover the entire field, and the small competitors whose efforts are confined to restricted territories within a limited distance from the manufacturing plant. The small competitors may have an advantage over the large competitors and may be harder to dislodge. For that reason a map showing the territory of each competitor and the relative strength of each in his territory is of great value in laying out an advertising campaign.

12. *Comparison of freight advantages.*—In the distribution of many commodities, such as building materials and household furniture, some competitors have great advantages over others in freight rates. In determining on advertising campaigns to reach new territories, it is desirable to compare freight rates in these cases and to choose for extensive advertising those territories in which one has at least equal shipping opportunities with competitors. A map showing the location of each competitor and the territory into which he can economically ship, is helpful in choosing advertising mediums. Such a map should be compared with the circulation records of each advertising medium in each territory that is considered.

13. *Relative importance of competitors.*—In planning an advertising campaign, one should decide whether he is in a position to dominate his field, as far as the force of his advertising is concerned, or whether it would be better for him to use smaller space, perhaps more frequently, relying for the supreme competitive efforts on the sales force.

The A Company manufactures a specialty for farmers. It finds that seventy-five per cent of the business in its line is now done by one competitor. The remaining twenty-five per cent is divided among fifteen other small concerns of which the A Company is one. The leading competitor has used educational copy and large space in agricultural publications for five years. The business of the A Company will not warrant competition with the leader either in size of appropriation or in amount of space used. The A Company's advertising manager decides under these conditions to take smaller space but to appear in the agricultural publications regularly, always appearing in each issue in which his chief competitor appears. The copy is intended to bring inquiries at low expense, rather than to make sales, on the theory that a farmer will wish to investigate more than one make of the particular specialty before he buys, and that if each advertiser receives an inquiry or a proportion of the inquiries, he must leave the closing of the sale to his sales force.

An entirely different plan of procedure was adopted by a maker of men's furnishings. On investigation he found that while one competitor stood out head and shoulders above all others, this competitor actually controlled only twenty-five per cent of the market; the investigator controlled twelve per cent; another competitor controlled ten per cent; and the rest of the market was divided among thirty competitors controlling in no case more than seven per

cent each. The leader in the field, while spending a certain amount for advertising, did not spend in proportion to the amount of business he controlled. The manufacturer in question decided that there was an opportunity for him to become the leader in his line. While he was not the leader in volume of sales, he determined that his advertising should have the appearance of leadership. He employed a famous illustrator to make all the illustrations for his advertisements. All the type was hand-lettered by the best designers. His cuts were in every way superior to those of his competitors. The size of space used was carefully planned to be larger and more commanding than that of his competitors. This plan was consistently followed thruout all the advertising, and today this manufacturer controls over sixty-five per cent of the business in his line.

What are the things which help to create good-will for the business in which you are most interested?

What things might you learn from "bleeding" your competitors' follow-up? Is there anything unethical in this practice?

Is there any weakness in your competitors' sales policies of which you could take advantage?

How can a competitor's price arguments be made ineffective?

What may an advertiser learn from a map of the territory his competitors cover?

Under what condition has an advertiser the best opportunity of becoming the leader in his industry?

## CHAPTER IV

### THE ADVERTISING APPROPRIATION

1. *How much to spend for advertising.*—The answer to the question, “How much will it cost to advertise?” is much like the answer to the question, “How much will it cost to build a house?” A house may cost all the way from a few hundred dollars to a few million dollars, depending on what the owner needs or thinks he needs. If it is only shelter he wants he may obtain it very cheaply, but mere shelter is not the only consideration. Before a man starts to build a house, he usually has in mind an approximate price which he hopes will build for him a house representative of his social standing. Even in the same social group, two men may spend widely varying amounts for their homes, depending on their tastes and the size of their families. In advertising, the amount of the investment depends on the purpose to be achieved, on the actual or desired position of the advertiser in his field, and on his individual tastes and preferences.

2. *The value of records.*—Some mail-order advertisers have kept records for years, so they feel they can tell within a few hundred dollars the amount of business that may be secured from any given appro-

priation. In this chapter we shall discuss the different methods employed by leading advertisers in determining their annual advertising appropriations, and shall leave the reader to choose what he considers the best method to follow in planning an advertising campaign for any product that he might wish to advertise.

3. *Time required to reduce selling cost per unit.*—Advertising requires three things: time, money and intelligence. At the start of a campaign, advertising seldom pays; it usually takes time to produce satisfactory results. As the farmer plants his seed and waits, knowing full well that, if the seed is right and the soil is right, the harvest will come; so the advertiser invests his money and waits, knowing full well that, if his advertisements are intelligently prepared and if he has chosen his market and his plan carefully, time will bring the harvest.

When the Russell-Miller Milling Company began to advertise Occident Flour, the officers knew that successful advertising does three things:

First, it increases the asset of good-will in a business.

Second, it produces volume of sales, which usually results in decreased manufacturing cost per unit.

Third, by increasing the volume it ultimately decreases the unit selling cost.

As none of these things comes in a minute or a month, the advertising expense was neither immediately listed as an asset nor charged to selling ex-

pense. The first appropriation was for \$600,000, one-third of this to be spent annually for three consecutive years.

"Our expenditure for advertising," said Mr. H. S. Helm, the general manager, "was undertaken with no thought or expectation of an early harvest on the seed sown. It was considered at the start that material returns should not be conservatively looked for short of three years' continuous advertising.

"The undertaking was looked upon and treated as an *investment in good-will and insurance on business already established*. It was perfectly plain that the current business, or that of the very near future, could not stand an increase in per barrel selling cost to absorb the advertising expense. We therefore made our appropriation covering a period of three years and prepared to charge the advertising out as *expended from past earnings and surplus until such time as it could be charged to the current selling cost without increasing the per barrel selling cost.*"

Six hundred thousand dollars, on an intangible and new venture, taken right out of past profits, requires nerve, as every advertising man knows; but the results have already proved the soundness of the theory; the selling cost per barrel has so far decreased that instead of waiting three years, after the end of the second year the company charged the advertising expense as part of the current selling expense. And still the investment in good-will, because it is real good-will, goes on drawing compound interest. Dur-

ing the first two years of national advertising, the consumption of Occident Flour has increased over five times as fast as the actual selling cost.

4. *When advertising begins to bear fruit.*—An interesting example of the way advertising affects the sales curve is shown in the accompanying illustration, taken from the records of the business of the

WAY SAGLESS SPRINGS

Reproduced with permission of *Printers' Ink*.

Way Sagless Spring Company. From the beginning of 1910 to the middle of 1912 the advertising appropriation in dollars greatly exceeded the sales of springs. After the middle of 1912, while the advertising appropriation constantly increased, the sales curve increased at a much faster rate. Experi-

ences such as this lead advertising men to believe that in the beginning the amount of the appropriation cannot be expected to have a direct ratio to the resulting sales.

5. *Basing the appropriation on a specified amount per unit of expected sales.*—In attempting to insure permanent sales success some advertisers base their appropriations on a certain number of cents per unit of expected sales. They reason rightly that it is not enough to sell to jobbers and retailers alone. They must help the dealers to make sales to consumers. It is worth a certain amount per unit to assure the dealers that consumers will know of the product and will demand it.

The Dayton Engineering Laboratories Company sold 12,000 "Delco" starters to manufacturers in 1912. At the beginning of 1913, this company had already contracted with manufacturers for 25,000 systems. It decided that it could afford from sales expense a dollar for each system sold to educate the public to the merits of the product. Therefore the first advertising appropriation was \$25,000. The advertising was so successful, however, that the company actually sold 37,000 systems during 1913. The advertising appropriation has been increased each year on the basis of the number of systems contracted for, but the price of the system and the appropriation per unit have decreased, so that today the advertising appropriation is probably less than fifty cents a machine. In February, 1916, the com-

pany had already taken orders for more than 250,000 systems for 1917 delivery.

The Creamette Company estimates that it can afford to spend ten cents a case in advertising Creamettes. Each year the advertising appropriation is based on an amount equal to ten cents a case of expected sales. By following the sales curve the company is able to estimate approximately the number of cases it should sell during the year.

6. *Basing the appropriation on a certain amount per possible purchaser.*—Other advertisers look at the problem from the angle of possible purchasers rather than sales. They consider advertising purely as memory insurance. Except in cases of very seasonable articles, one can never tell just when his prospects are thinking of buying. If an advertiser feels certain that his possible customers will remember his brand favorably whenever they are ready to buy, he may feel that his sales are more than half made. These advertisers consider it worth so much per buyer per year to be sure that their products will remain in the memories of their possible customers.

Coca-Cola, with its annual advertising appropriation, which is said to be \$1,200,000, spends in this country of 120,000,000 people, approximately a penny a year a prospect for memory insurance. A manufacturer of ornamental iron and bronze, which is used only in large buildings, spends two dollars a year a prospect for such insurance. There are in this country only 1,000 architects with whom he can

do business profitably. His advertising costs \$2,000 a year. Most of it is spent in reaching architects direct by mail. Coca-Cola, on the other hand, may be purchased by anyone, and everyone is a possible customer. When Coca-Cola makes a sale, the exchange is for a nickel. When the other man makes a sale, the sum involved runs into the hundreds of thousands of dollars. One can afford to pay more per unit. The other can afford to pay more in the total.

Ivory Soap is another example of a product with a practically universal appeal on which is spent approximately a penny a possible purchaser a year. Wm. Wrigley, Jr., is said to spend two cents a person a year to advertise his gums. His advertising appropriation is reported to be \$2,500,000 annually.

7. *Basing the appropriation on the amount of capital available.*—The average advertiser is not, however, in the financial position of the Coca-Cola Company, the Procter & Gamble Company, or William Wrigley, Jr. The question with him usually is, "How much can I afford?" In such cases the advertising campaign must be planned to fit the conditions. Even the largest national advertisers commenced in a small way. They planned their advertising campaigns to cover one city or one district; then, as their business grew, they extended the advertising until they finally secured national distribution and were able to make their appropriations on the basis of national demand.

In studying the different methods of determining the appropriation, one must bear this fact clearly in mind: It is just as unprofitable to spend too much as it is to spend too little; and the more quickly an advertiser can get his business into a condition in which it is possible to fix his advertising appropriation on some carefully selected and tested basis, the more certain will be his success.

8. *Basing the appropriation on cost per inquiry and per sale.*—Probably the most scientific method of determining the appropriation is that adapted by a certain mail-order specialty house. They know exactly how much they can afford to spend to make a sale. After years of careful record keeping, they know what proportion of inquiries can be turned into sales and the cost of the follow-up literature for each inquiry. These advertisers usually place contracts for only a few advertisements in a publication at a time, carefully checking the cost per inquiry, and discontinuing the advertising whenever the cost per inquiry proves excessive.

The following quotation from Shryer's "Analytical Advertising,"<sup>1</sup> is taken from the records of such an advertising campaign conducted several years ago. The advertiser used various styles and sizes of copy, but the analysis has reference only to a two-inch, single magazine column advertisement which was run uniformly in a large number of mediums.

<sup>1</sup> "Analytical Advertising," by W. A. Shryer, pp. 137, 144, 145.

The advertisement offered a combination of merchandise selling for slightly less than \$30. A small payment with the order, with regular monthly instalments for the balance covering a period of nine months, secured the goods. Most of the advertising was placed at the old "publishers' rates," which accounts for an advertising cost considerably less than the present price for space. Had the present rates been paid, practically all the results would have shown a loss.

The copy was "inquiry copy." Each inquiry was followed up under one-cent postage with a series of letters to the number of five. Each piece of copy was keyed differently every month, giving opportunity for analysis on each separate piece of copy run in any publication. Eighteen publications were tried with more or less consistency. A record is here given of returns from one publication (*System*) by months and also a record of the total returns received from all eighteen publications.

9. *Basing the appropriation on a proportion of the profits of the previous year.*—An increase in the advertising appropriation is one of the most definite indications of a desire to grow. Some advertisers at the end of the year, instead of putting the profits of the business into surplus, put a certain amount into advertising for the coming year. One advertiser reasons that, as his business increases, he will need new plants and additions to his present factories. Each year he lays aside a certain amount of his profits to-

ward the day when he will need these new factories. He also realizes that to obtain demand sufficient to require new factories, he must increase his advertising. He decides that if his profit amounts to twenty per cent, he will put five per cent of that profit into advertising and five per cent into surplus. If his profit amounts to thirty per cent, he will put ten per cent into advertising and ten per cent into surplus.

10. *Basing the appropriation on amount spent the previous year.*—Many advertisers have no more definite basis for estimating their appropriations than the amount they spent the year previous. If this amount is used simply as a starting point from which to figure a possibly increased appropriation, there is no objection to its use. But if the advertiser blindly appropriates for one year the same amount he spent the year before, without regard to the developing needs of his business, he can hardly expect to meet changing conditions or to make progress. One of the leading advertising agents will not take an advertising account unless the advertiser is willing to increase his appropriation at least fifteen per cent each year, providing his business warrants it. He does not care to handle an account unless the business of the advertiser is to grow, and he estimates fifteen per cent as the lowest normal, healthy increase of a business that does consistent advertising.

11. *Basing the appropriation on the space desired.*—To make the desired impression with certain advertising campaigns, it is advisable to use a certain

amount of space or else not to attempt advertising at all. If an advertiser wishes to dominate and to use only full pages, it will cost him a certain amount of money.

The magazine publicity of the National Cash Register Company is estimated on such a basis. An advertising campaign, using full pages, extending thru 1915, and carrying the message, "Business is Good," could not possibly have accomplished its purpose if the advertiser had confined himself to small space—one column, three-inch copy, for instance. Such small space advertising would, in fact, have made the opposite impression from that desired; it would have been much better not to advertise at all than to spend so little an amount of money. Advertising men often have in mind a certain amount which it is necessary to spend in a national campaign for a product of general consumption, to accomplish satisfactory results. In planning such a campaign, one must first decide on the advertising needed and then estimate its cost.

12. *Basing the appropriation on the difference between selling expense and price plus reasonable profit.*—Many advertisers have developed ingenious methods of fixing appropriations—methods that relate particularly to their own business and are based for the most part on the desire of the advertisers to make as much progress as possible without running themselves into debt. One of these methods is to determine the amount of profit desired, together with the cost of manufacturing and the expense of selling each

unit of the product, and then to spend the difference between these two figures, multiplied by the number of units the manufacturer expects to sell. This method is illustrated by the following extract from *Printers' Ink* (May 6, 1915):

Suppose we have a breakfast food, in the class which can be sold at retail for 15 cents a package. It costs \$2 to produce a case of 36 packages, which are sold to the consumer for \$5.40. The jobber pays \$4.15 per case, and sells to the dealer at \$4.40. Thus out of our gross margin of \$3.40, the jobber absorbs 25 cents, and the dealer gets 90 cents, leaving \$2.15 for our own selling cost and profit. We set aside a tentative 10 per cent for our profit, which amounts to  $41\frac{1}{2}$  cents on the jobber's price of \$4.15, and we find there is left for selling cost, including the advertising, the magnificent sum of \$1.73 $\frac{1}{2}$  per case.

Now the experienced breakfast food men in the company tell us that it is not safe to allow less than a dollar per case for the direct selling expense, exclusive of the advertising: so that we have left  $73\frac{1}{2}$  cents which may be spent for advertising to sell a case of 36 packages to the consumer. In other words, we have arrived at the conclusion that we can afford to spend for advertising during the first year, 2.04 cents per package, or, to put it a bit differently, we can spend 2.04 cents per family in the territory we are to reach. Assuming that there are an even million families in our market, our first year's appropriation will amount to \$20,400.

It will be noticed at once that this hypothetical concern is beginning in a small way, covering perhaps a single state the first year. At the end of that year it finds that it has sold 15,000 cases of goods. Its gross sales amount to \$62,250, and its expenses have been \$62,400; a net loss. But when it comes to analyzing its selling cost, instead of finding that the sales force has absorbed a dollar a case as was anticipated, it finds that this item has been reduced to 80 cents. It is only fair, and quite reasonable as well, to credit that

saving to the consumer advertising which has made it that much easier to stock the jobber and dealer. So, for the following year we have a margin for advertising of  $93\frac{1}{2}$  cents per case instead of  $73\frac{1}{2}$  cents. We can spend 2.59 cents per family instead of 2.04 cents. Our original territory would command an appropriation of \$25,000 for next year.

But we have already reached upward of half of our million families in that territory, and they present a nucleus of goodwill. Many of our jobbers sell to dealers outside of the restricted territory. We have earned no profits yet, but our selling cost is coming down, and we can see daylight ahead. So we take on an adjoining district containing a million families more, and our appropriation for advertising becomes \$51,800 for the second year.

Next year we sell 35,000 cases. Our gross sales are \$145,250. Expenses are \$148,050. Still the balance sheet shows a net loss, but the selling cost is down to 75 cents. We have a margin per case of  $98\frac{1}{2}$  cents now. We can spend 2.75 cents per family. We spread out still farther, and, on a basis of 3,000,000 families, our third year's appropriation is \$81,900.

The third year shows a profit on sales of nearly 100,000 cases, and the selling cost comes down to a fraction above 71 cents. Our advertising margin is now better than a dollar per case, and is approaching three cents per family. There is no need for further illustration, for the system should be perfectly clear. The appropriation is based on a certain expenditure per possible customer, and that expenditure is determined by the actual reduction in the selling cost thru the sales force.

The method outlined above represents an actual system which is in use by a manufacturer—not of a breakfast food, however. Of course, a question at once arises as to what is to be done when the selling cost reaches the point below which it cannot be reduced, or what would happen if the selling cost were to increase suddenly, due to business conditions, for example. The only answer is that the manufacturer would use his judgment. No system of figuring appro-

priations will take the place of common horse-sense. As an *aid* to good judgment, any system may be valuable, but no man has ever yet succeeded in finding a substitute for it.

**13. *Basing the appropriation on a certain per cent of gross sales.***—Probably the most popular plan of estimating the appropriation is on the basis of a certain per cent of gross sales. Some advertisers estimate on the basis of the sales of the previous year and others estimate on the basis of expected sales. This percentage differs, of course, for each class of business usually for each business house in its class. Many advertising men object to this method because they contend that it costs a larger proportionate amount to build a business up than it does to keep it going. Up to a certain point, it also costs less proportionately to keep a big business going than it does to keep a small business going.

The advantages of the plan rest on the fact that a percentage basis gives every advertiser something definite to work on. From year to year an increasing number of business houses are beginning to know accurately their costs of doing business and are apportioning a definite proportion of this cost to each department. The Sherwin-Williams Company of Cleveland bases its advertising appropriation on three and a half per cent of its gross sales of all kinds of paint and other materials which it distributes. The Sherwin-Williams Company may put all of its advertising efforts on only one or two kinds of paint, but its appropriation is, nevertheless, based on its gross

sales of all its products for the year. When asked why this method was adopted and how the three and a half per cent was arrived at, the advertising manager said, "We have found that our advertising should be this proportion of our cost of doing business. We find that we cannot make enough progress if we spend less, and that we cannot show enough profit if we spend more."

14. *National advertisers' appropriations.*—Some advertisers simply follow the leader in making appropriations. In each class of business it is profitable to spend a different proportion of gross sales in advertising. The advertising manager of a large bond house says that his organization cannot afford to spend more than one-sixteenth of one per cent of its gross sales in advertising. The advertising manager of one of the leading transcontinental railroads says that two and a half per cent of the gross passenger revenue is as little as any railroad can afford to spend.

The following are the percentages of gross sales spent in the advertising of certain users of national publicity:

	<i>Per Cent</i>		<i>Per Cent</i>
Arrow Collars .....	3½	DePree Chemical Company.....	6
Baker-Vawter System.....	3½	Evinrude Motors.....	8
Berry Brothers' Varnish.....	4	Fatima Cigarettes.....	5
Cadillac Automobile .....	1	Globe-Wernicke Cabinets.....	3
Champion Spark Plugs.....	7	Great Northern Railroad.....	1.83
Cloth-craft Clothes.....	1½	Hudson Automobile .....	1.3
Colgate's Preparations .....	2	Ivory Soap.....	3

	<i>Per Cent</i>		<i>Per Cent</i>
Kewanee Boilers.....	2½	Saxon Automobile.....	2.6
Kodaks.....	3	Sears, Roebuck & Co.....	10
McCray Refrigerators.....	7½	Sherwin-Williams Paint.....	3½
Markham Air Rifles.....	5	Stromberg Carburetors.....	3½
Northern Pacific Railroad.....	1.9	Studebaker Automobiles.....	2
Old Dutch Cleanser.....	10	Union Pacific Railroad.....	2½
Packard Automobile.....	1.1	Universal Portland Cement.....	2
Phonographs.....	5	Velvet Tobacco.....	6
Reo Motor Cars.....	1	Welch's Grape Juice.....	10
Ruud Heaters.....	2½ to 3½	Wooltex Clothes.....	2
Santa Fe Railroad.....	2½		

These are all large advertisers; their appropriations all run well over one hundred thousand dollars and some of them over a million dollars annually.

15. *Retailers' appropriations.*—Retailers, dependent for the success of their advertising on sales made from day to day, and spending the larger amount of their appropriations in newspapers which are usually read and destroyed every twenty-four hours, are able to gauge the returns from their advertising more definitely than national advertisers. The prevailing custom among retailers is to base the appropriation on a certain percentage of gross sales. The retailer's cost of doing business is increasing, and the intelligent dealer knows exactly how much of this cost he can afford to appropriate for rent, how much for bad debts, how much for clerks and how much for advertising.

It is said that in the early days John Wanamaker was able to keep his advertising appropriation down close to two and one-half per cent of sales. Today

his appropriation is said to reach five per cent. Gimbel Brothers, a newer store in New York, called upon to do aggressive advertising in anticipation of business, is said to have spent considerably over six per cent. Leading authorities say that the successful department store of today should spend at least three per cent. Yet it is understood that Marshall Field & Company, which does about twenty-eight per cent of all the department store business in the city of Chicago, spends approximately \$500,000 annually for advertising, and keeps its appropriation down to only a little over one per cent of its gross sales.

16. *Advertising of small stores.*—An investigation of the businesses of over 1,500 retail stores, some of which are consistent advertisers and some of which do not advertise at all, shows the following average percentage of gross sales spent for advertising in the following different classes of retail establishments:

Groceries .....	.83%
Hardware .....	1.12%
Vehicles and Implements.....	1.22%
Variety Goods .....	1.52%
Shoes .....	1.65%
Dry-goods .....	1.67%
Furniture .....	2.72%
Jewelry .....	2.85%
Clothing .....	3.16%
Department Stores .....	4.01%
Mail-order Houses .....	7.21%

It must be remembered that this is only an average, and that many of the stores listed spend nothing at

all for advertising, thus bringing the charge down.

17. *Dividing the retailer's appropriation among departments.*—Some departments of a retail store require more advertising than others. Some departments are used as leaders, and are expected to show only a very small profit. The advertising of the commodities in these departments helps to sell those of other departments. A department store advertising manager in dividing his appropriation often attempts to give different percentages of his gross appropriation to each department, the division of the appropriation depending on the relative importance of the departments. The following list gives by departments the percentage of gross sales spent for advertising in twenty of the leading department stores of the United States. The total expenditure for the period amounted to two and one-half per cent of gross sales. The figures represent the percentage of gross sales of each department which were expended directly for advertising to sell the goods of these departments plus a general overhead charge of six per cent. The list is reprinted from *Printers' Ink* (July 6, 1916).

18. *Apportioning the appropriation.*—The national advertiser in apportioning his appropriation has a much more difficult problem than that of the retailer. The question has often been asked, "How much should be apportioned to general publicity and

how much to dealer advertising?" The amounts apportioned vary, from the Cream of Wheat Company, which spends one hundred per cent in general publicity, to Sears, Roebuck & Company which spends practically all of its appropriation direct thru the mails. The advertising department of the Cream of Wheat Company, which is said to spend over \$500,000 annually, consists of one man, Colonel Emery Mapes himself. The advertising department of Sears, Roebuck & Company consists of 1,300 people. No general rules can be given in regard to the division of appropriations, but the following figures may be of interest:

#### APPORTIONMENT OF PUBLICITY AND DEALER ADVERTISING IN DIFFERENT LINES

<i>Classes of Merchandise</i>		<i>General Publicity</i>	<i>Dealer Publicity</i>
4	Jewelry Manufacturers . . . .	73 per cent	27 per cent
4	Automobile Manufacturers.	90 per cent	10 per cent
6	Food Manufacturers . . . . .	85 per cent	15 per cent
3	Women's Clothing Manufac- turers . . . . .	95 per cent	5 per cent
7	Office Equipment Manufac- turers . . . . .	75 per cent	25 per cent

#### REVIEW

Why are patience and persistence necessary in undertaking an advertising campaign? How long do you think it would be before unit selling costs could be reduced, thru advertising, in some business in which you are interested?

Why not make the appropriation the same from year to year?

In what class of cases would it be better not to advertise at all, if one could not use large space?

What are the advantages and disadvantages of estimating appropriations on the basis of a certain percentage of gross sales?

Why do department stores spend more to advertise men's neckwear than to advertise notions?

In the business with which you are most familiar what would be the best method of fixing the amount of the advertising appropriation?

## CHAPTER V

### METHODS OF IDENTIFICATION

1. *Necessity of identification.*—The pivot around which every advertising campaign revolves is the thing or things by which the public is to identify the article or the service advertised. This may be a name, a mark, a package, a slogan, or one or more of many other things. Whatever it is, it must have individuality, and it must be repeated on the product and in the advertising. It has been said that the Royal Baking Powder Company has been offered \$5,000,000 (a million dollars a letter) for the right to use the name “Royal” in connection with baking powder. The great value attached to this name is the result of two things: (1) Royal Baking Powder has always been sold in containers which prominently display the name; (2) the public thru advertising has been educated to look for the Royal Baking Powder can. If Royal Baking Powder had been sold in bulk, the public could not have identified it in the grocery store, and all the advertising the company has done would have served no purpose. Identification is one of the chief purposes of advertising. In a decision rendered by the Supreme Court of the United States, Justice McKenna said: “Advertising

is merely identification and description. . . . It has no other object than to draw attention to the article to be sold."

2. *Packages make advertising possible.*—In the beginning, most products were sold in bulk. During the last century, ingenious manufacturers have changed our entire method of purchase by introducing standardized articles which they have identified in ways different from those of competitors. Goods, formerly sold in bulk, had to be put in packages in order to be identified. We have seen one article after another finally put into a package and trade-marked. The seller of seeds had no opportunity to advertise until he put his seeds in packages. He could not stamp his name or his trade-mark on each individual seed. The fruit growers of the West have gone one step farther and have stamped the trade-mark "Sun-kist" on the wrappers of their oranges. For a long time it was thought impossible to put oysters on the market in trade-marked form, but the Seal-Shipt Company has proved it possible. Fifty years ago some manufacturers of textiles sold their cloth in bolts with trade-marks pasted in paper on the outside. Today many textile manufacturers weave the trade-mark into the selvage.

Before a manufacturer begins to advertise, he should clearly study the different methods of identifying his product, and of giving individuality to his advertising.

3. *Methods of identifying the product.*—There are

three general methods of identifying a product, its wrapper, or the package in which it is contained:

1. By the use of a trade-mark or other individual design

2. By the use of a distinctive shape

3. By the use of a distinctive color.

Trade-marks are the means of identification most generally used. They are discussed in detail in the Text on "Advertising Principles."

4. *Shape as a means of identification.*—A distinctive shape for a product or its container is a commonly employed method of identification. Automobile manufacturers have largely used it. While trade-marks are placed on the radiators, the hubs of the wheels and on other parts of automobiles, the average schoolboy can tell the name of almost any car, even when it is in motion, by its general lines and the individuality expressed in the shape of some prominent part, such as the hood.

The makers of Log Cabin Maple Syrup sell their product in tin packages shaped like a log cabin. While the shape is an inconvenient one from the standpoint of packing it is very convenient from the standpoint of identification.

One of the most interesting wars of modern times is being waged between rival manufacturers of shaving soaps. It would take an expert to distinguish the difference in quality between many of the substances themselves. The contest in the rival advertising campaigns rests almost entirely on the attrac-

tiveness and the convenience of the package. One manufacturer gets out a new and more convenient package in a distinctive shape, and the public swings to the use of that particular shaving preparation. Then another comes into the field with "We couldn't improve the powder, so we improved the box," and the trade swings back again. Next a campaign is based on "The box that locks," and this appeal, in turn, is matched by some other ingenious device of a competitor.

5. *Color as a means of identification.*—There is nothing so quickly recognized by the normal eye as color. A manufacturer of a line of toilet preparations uses the same color scheme for the packages of all his products, and he reproduces these colors wherever possible in his advertising. Manufacturers of automobiles in the beginning of the industry attempted to use this method of identification. The White automobile was painted white. In bygone days an advertising campaign for a bicycle was based on the slogan, "Look for the yellow fellow." With certain products, the use of color is impossible. With others it is objectionable to the consumer. This was found to be the case in automobiles when very bright colors were used. While, today, colors are still used to identify certain makes of cars, the colors have generally been greatly subdued. Taxi-cab companies, however, have used bright yellows, greens and reds to give individuality to their vehicles.

There was a time when department stores wrapped

their packages in bright colors, and advertised the fact. People objected to being used as walking advertisements, and this method of identification has been discontinued to a large extent. The use of colors, however, is worthy of consideration in any advertising campaign because color is probably the most striking and at the same time the most simple method of identification. Possibly the advertising of Sunshine Biscuits could be made more effective if the packages were a bright sunshine yellow.

6. *Methods of identifying the advertising.*—It is not enough to give to the product or its package an identity so that the consumer can easily recognize the article and ask for it by name. The advertising of the product should also have an individuality—it should possess a certain distinctiveness that binds the whole campaign together and which helps to give a cumulative effect to everything that is done by the advertiser to influence the mind of the consumer. Wherever possible there should be a family resemblance between the advertising and the product. For instance, if a trade character, such as the Dutch woman of Old Dutch Cleanser, appears on the package, it should appear too in the advertising; or if distinctive colors are used on the label—the red and white of Campbell's soups, for example—they should be used as often as possible in those forms of advertising that permit the use of color.

In the case of some articles it is not possible to link up closely the appearance of the advertising, but this

does not deprive the advertiser of the opportunity to give individuality to his publicity. He has many ways of binding all his advertising together. Individuality in advertising, of course, should not mean monotony. It is entirely possible to maintain a family resemblance without making all advertisements alike. An often unattainable ideal is expressed by one advertiser: "Let there always be in each advertisement something which is the same and something which is new." The Cream of Wheat Company uses its famous negro chef in all its advertising. The reader can immediately identify a Cream of Wheat advertisement by this figure, altho each advertisement shows the negro in a new position. The negro chef and the name, Cream of Wheat, are the pivot of all the manufacturer's publicity.

Advertisers use many different ways to make their advertising distinctive and immediately identifiable. Among them are the following:

1. The name
2. The trade-mark
3. A typical character
4. A slogan
5. Borders
6. Backgrounds
7. Styles of type faces
8. Styles of type composition
9. Technique of illustrations
10. Style of copy

11. Uniform proportions
12. Color
13. Position in the publication.

7. *Names and trade-marks.*—The repetition of the trade-mark or the name of the article or of the manufacturer in all advertisements is too common a method of identification to need illustration. Altho the subject of names and trade-marks is fully discussed in the Text on “Advertising Principles,” it is well here to warn the advertiser of the necessity of simplicity. Many advertisers make the mistake of expecting the reader to remember too much. A simple name should be chosen, and yet a satisfactory simple name is exceedingly hard to find. All the common names have been preempted long ago. There are over 10,000 registered names for brands of flour alone. There are said to be nearly 200 Star brands of one kind or another on the market today. There are over 180 Standards, over 50 O. K.’s and 44 Twentieth Centuries. From the standpoint of registration as well as from the standpoint of distinction, it is often advantageous to choose a proper name, a fanciful name, or a name having its derivative in another language, such as Kodak, Phonograph, Crisco and Crex. Uneeda is in a class by itself; and any combination of letters to sound like words, even if it can be registered, seems to be considered by the general public as an attempt at imitation of Uneeda. In the South, when the negroes wish to purchase Takhoma bis-

cuits, they often say, "Gimme dat Uneeda biscuit in d' red package."

A fanciful or new name, on the other hand, strikes the public so unfamiliarly as to require a distinct effort to remember and pronounce it. Some of the best names are those which thru other associations have become familiar, and are not exactly descriptive but may at least be called relevant.

Mr. Edward S. Rogers, lecturer on the law of trademarks at the University of Michigan, tells a story of a housewife who, when asked in court how she usually called for a certain article, replied, "If I see it, I point to it, but if I don't see it, even if I have taken a special trip to purchase it, I don't ask for it. I never heard how to pronounce it and I don't want anyone to think I'm a fool." To its manufacturer the name of this product probably seems very easy to pronounce. An advertiser has no right to expect a person to inquire the correct pronunciation of the name of his product. No one will ever know how much business some concerns lose because the names of their products are not easy to pronounce.

It is much easier to say "Tiffany's" than "Hart, Schaffner and Marx." An example of the shortening of a firm name is the now famous "B. V. D." A growing custom for a manufacturer with but one product is to include the name of the product in the name of the company producing it. It is asking the public a good deal more to remember Munsingwear, made by the Northwestern Knitting Company, than

it is to remember Cream of Wheat, made by the Cream of Wheat Company.

8. *Typical characters*.—Well-known examples of typical characters, used to give individuality to a manufacturer's advertising, are the Cream of Wheat chef, Gold Dust Twins, Swift's Little Cook, the Wool Soap children and the Quaker of Quaker Oats. In adopting a trade character some advertisers overlook the fact that the public is not prone to talk about the character unless the character has a name; furthermore, the name should preferably suggest the name of the thing advertised. The Gold Dust Twins are affectionately known by that title, and one cannot think of them without thinking also of Gold Dust. We know Phoebe Snow, but we may have to think twice to connect Phoebe Snow with the Lackawanna Railroad. The negro used by the Cream of Wheat Company has not been given a name; it would be easier for the public to talk about him if he had a name, stamped perhaps on his cap or apron.

An advertiser must remember that the first duty of a trade character is to identify his product. Some people attribute the comparative failure of the breakfast food, "Force," to the fact that there was not in the minds of the people a clear relation between Sunny Jim and the product he attempted to advertise.

A trade character should be distinctive. Many advertisers attempt to use photographs of little girls in connection with their products. Very few people recognize these as typical characters. They are not

sufficiently distinctive. Even if the figure of a girl or woman is always clothed in the same way, unless the dress is as distinctive as the dress of the Old Dutch Cleanser character, for instance, the public may fail to recognize her.

While it is possible to move the character, one must be careful not to move it too much. The character of Sunny Jim was first used in the street cars in profile. When the magazine advertising commenced, a front view was shown of his face, and the public became acquainted with him all over again. While the Cream of Wheat negro is always shown in different positions, you have never seen his face in profile. His head is moved, but his expression and the three-quarters view of his face have never been altered. Even to change his face to a full front view would probably make him look like another character to the reader. It is easier to identify a character by its form and by its clothing than by the eyes, nose and mouth. From this standpoint, the Old Dutch Cleanser character is easier to recognize than the Pompeian girl.

9. *When typical characters are inadvisable.*—Recognition of trade characters depends on repetition. Some local advertisers at different times have attempted to use such characters, but have found their advertising appropriations were not extensive enough to force the characters into general recognition. Once a character is adopted for a particular product, no piece of advertising for that product should be without the character. It is necessary, therefore, for

the advertiser to consider carefully if there are any cases in which the introduction of this character might embarrass him. Adopting a typical character for your product is like adopting a child in your home. You should first make certain that the child is or will be everything you expect of him and then you should treat him as a part of your family.

10. *Requirements of a slogan.*—It is customary among many advertisers to pick out some selling phrase and to use it in all advertisements. Some advertisers believe a slogan is only a clever, flippant phrase with which to identify a product. Others base their entire sales efforts on slogans. Some use the same phrase indefinitely thruout the life of a business, while others use a phrase for five or ten years and then take up another one.

Gold Medal flour has spent a great deal of money in popularizing slogans. For several years the company based its sales efforts on the slogan, "When you think of flour, think of Gold Medal." Millions of dollars were spent to enforce this one command. After about ten years the company dropped the old slogan and introduced a new one, "Eventually—Why not now?" This phrase was put on the company's letterheads, on the sacks of flour and on every piece of advertising emanating from the company.

The Pillsbury Flour Mills Company is also a user of slogans. In 1916, this company undertook to capture the word "Because." The Pillsbury Company

has spent large sums on the slogan "Because Pillsbury's best."

If anyone doubts the power of slogans to identify products, he has only to repeat to himself, "It floats," "Hammer the hammer," "Chases Dirt," "Ask the man who owns one," "One of the 57," and see if in every case he does not immediately remember the product with which the slogan is associated.

11. *Typographical means of identification.*—Some advertisers use a particular style of border thruout an entire campaign, and this border, immediately recognized by the reader, helps to give character to, and identify the advertising even if the reader does not take time to read all the advertisement.

Some advertisers always use the same tone of background. This is particularly noticeable in the Gold Medal flour advertising. The gray background becomes a characteristic of the advertising and a definite means of identification.

Still other advertisers insist that all their advertising be set in the same style of type, or, if they are hand lettered, that the style of lettering be always the same. This is particularly noticeable in the Tiffany advertisements.

Many advertisers in striving for individuality, insist on the composition of all their advertisements being exactly the same. While the copy is changed, the cuts are always in the same relative position and there are usually the same general blocks of type. The

Dodge Brothers automobile has been advertised in this way.

12. *Individual style in illustrations and copy.*—Some advertisements have all their advertising illustrations made by the same illustrator. The illustrations by J. C. Leyendecker for the advertisements of Arrow Collars have given individuality to this advertising which is immediately recognized. Even when some other artist has been employed to illustrate the Arrow advertisements, he has been expected to follow the distinctive Leyendecker technique. It is thru methods such as this that an advertiser obtains “atmosphere” for his advertisements.

Uniformity in the style of the copy is also used to give character and distinction. Prince Albert tobacco was introduced by a decidedly distinctive copy style. Velvet tobacco has a different style which would probably be recognized and attributed to Velvet Joe even if it should be copied by another advertiser.

13. *Uniform proportions and colors.*—While it is seldom advisable in any campaign always to use the same amount of space for all advertisements, some advertisers give their advertisements distinction by using space that has the same physical proportion. The public always sees advertisements of the same shape no matter what the size may be. Such advertisements are called “telescope ads.”

While colors other than black and white can be used only by few advertisers in periodicals, color is often

used as a method of identification in outdoor advertisements. The Coca-Cola Company consistently uses the same color for the background of its bulletin boards, and the Coca-Cola advertising is beginning to be recognized by this color combination.

14. *Position in publications as a means of identification.*—Another way to identify one's advertising is to insist on its being placed always in the same position in a newspaper, or on the same page in a magazine. Some advertisers take only back pages. Some take inside covers, and others take the first and second pages of all publications. The Big Ben advertising usually appears on the first inside page. People have begun to recognize the smiling face of Big Ben in this position. The advertising manager in planning this campaign contracted for space a year in advance in order to be able to secure this position.

15. *Relative value of different methods of identification.*—With so many methods of identification at his command the advertiser is confronted with the problem of which to choose for his particular purposes. The problem requires individual analysis and judgment. While it is possible to use many methods of identification in combination, it is difficult to display a name, a trade-mark, a slogan, a standardized border, a standardized style of type, and all the other distinguishing features of an advertisement without having one overweigh the others. Which is the most important? The only satisfactory answer to this question comes from tests of advertisements and sales over

a long period of time and the comparison of these results with costs.

Cheney Brothers of South Manchester, Connecticut, makers of silk, prepared a set of questions in regard to nationally advertised products. These questions were asked of a number of men and women in the employ of the company in order to ascertain whether it is easier to remember an article when the firm name is emphasized, when the name of the product is emphasized, when the trade-mark is emphasized or when a slogan is emphasized. The questions which were the basis of the test were:

A.—What are the products manufactured by firms using the following names: Hamilton, Oneida Community, Welch, Peter's, Gillett, Ford, etc.

B.—What are the following products and who makes them: Bon Ami, Beaver Board, Nabisco, Pompeian, Big Ben, Prince Albert, etc.

C.—What are the trade-marks used by: Heinz, Old Dutch Cleanser, National Lamp Company, Skinner's Satin, Beaver Board, etc.

D.—Who says: "Ask the man who owns one," "Good-bye, old hook and eye," "Hammer the hammer," etc.

These tests showed that the question most generally answered correctly was the first, "What are the products manufactured by firms using the following names?" A fewer number of people could identify the slogans; still fewer could describe trade-marks; and the smallest number of all gave correct answers to

the question, "What are the following products and who makes them?" This test was conducted on a very small scale, and the results cannot be accepted as establishing definite principles. Nevertheless, the test is interesting as indicative of the advisability of joining the firm name with the name of the product. In this test the answers of women were tabulated separately from the answers of men. In most cases there was little difference between the two sexes; women, however, were found to remember slogans more easily than men.

## REVIEW

What is the best means of giving individuality to the product of the business with which you are connected? If the product is service instead of a tangible article, are there any ways in which the service can be given that kind of distinctiveness which aids the public in recognizing it?

If your business advertises, or were to advertise, what methods of giving individuality to the advertising might be used? Why is it a good thing for advertisements to have individuality?

Under what conditions is it possible and desirable to use a trade character?

What are the requirements of a good slogan?

## CHAPTER VI

### THE ADVERTISING DEPARTMENT

1. *The director of the department.*—Back of every advertising campaign there should be one man who is responsible for its success. His title may be advertising manager, marketing manager, advertising counsel, sales manager, sales and advertising manager, president, general manager, merchandising director, or perhaps something different from any of these. But whatever his title, his duty is to devise and execute ways and means to promote the business thru publicity.

Sometimes one individual is responsible for all the sales activities of a business. He may personally supervise the technique of advertising as well as the technique of personal salesmanship, or else he may give his time only to broad marketing problems, leaving the specific direction of advertising and of personal salesmanship to subordinates who do the detailed work of an advertising and sales manager. In other cases, there is no one officer who gives his time exclusively to all the marketing problems of the business; the advertising manager and the sales manager are relatively supreme in their respective fields, and their activities are harmonized only thru their volun-

tary cooperation and their common subordination to a general manager or a president, who finds time, among his other duties, to retain broad supervision of marketing procedure.

2. *Attributes of advertising manager.*—The ordinary title of the man who directs the publicity, regardless of whether he has or has not any authority over the personal salesmen, is advertising manager, and it is that title that we shall use. It is interesting to note some of the ways in which the attributes of a successful advertising manager differ from the attributes of the man, commonly called the sales manager, who supervises the work of the salesmen. The sales manager is responsible each month and each week for the sales. The sales manager brings in the harvest. The advertising manager sows the seed. He must have planned far ahead in his work. He must have vision. He must have imagination in its broadest sense. The salesman has his prospect constantly before him; he can change his line of argument to meet conditions. The advertising man must imagine all conditions and make his arguments fit these conditions in advance.

The advertising manager must have the power of analysis. He must be able to weigh values. He must understand how to keep the big idea constantly in mind, and yet must be a man who will not let the detail of a misspelled word escape his notice. Mr. William H. Ingersoll, marketing manager of Robert H. Ingersoll & Brother, says: "Little as it is recognized, advertising is one of the four or five great uni-

versal arts, and of these it is the most difficult, for not only does it require practical understanding of human nature and how it may be influenced, but also an appreciation of several other arts, including those of the printer, the writer, the painter, and the organizer."

The advertising manager is primarily an executive. He must understand organization, for it is his province to deal with many individuals in his organization and out. Many of the most successful advertising managers have never written a line of copy in their lives. They edit much of it and know how to weigh values; but often they do not involve themselves with the details of copy writing.

3. *Responsibility for the advertising.*—Few things in advertising are standardized; there are few principles to apply. Accordingly, personal judgment is always an important factor in deciding on the details of a campaign. It is natural, therefore, that the owners and general managers of a business should believe that their judgment is as good as the advertising manager's, and that they should wish to supervise many of his functions in detail. Where this natural attitude is too pronounced, there is grave danger of seriously handicapping the advertising manager by permitting the active interest of too many of the company's executives in the conduct of the advertising department. Advertising is fascinating, and everybody likes to have a finger in it. It is easy for the president of the company to insist on the necessity

of his approving so many details of the advertising that the advertising manager is likely to ask himself "What will please the boss?" rather than "What will make customers?" Many advertising campaigns have failed because the recommendations of the expert advertising manager have been altered in favor of plans based merely on the prejudices and personal opinions of his superior officers.

Mr. William B. Morris, advertising manager of the Northwestern Knitting Company, says: "Advertising is the product of imagination, of courage, and of other subtle, almost spiritual, forces which make it nothing short of cruelty to subject it to interference from those who have not seen the development of the idea from the moment of its inception. Yet I do not know of any department of any business which receives so much direction from other departments. Advertisements are the representatives, the ambassadors of the organizations, and they should express the policy and the spirit of that organization in every detail. It is right that 'those higher up' should give counsel, but they cannot in justice to themselves give attention to details unless they give all of their time to those details. The conscientious advertising man gets much valuable help from all other departments. He also gets valuable suggestions from children, from books and from his recreations. But if one man is to be *responsible* for the advertising, no one by interference should relieve him of that responsibility."

4. *Functions of an advertising department.*—An

advertising department may do much or little. It may initiate everything that is done in the advertising campaign, or it may simply focus things initiated by others. It may work wholly by itself, or it may lean heavily on the advertising agency. Probably no two advertising departments do exactly the same thing. There are certain activities, however, which are common to all campaigns, and which must be carried on by someone either in the department or out of it. These things are properly called the functions of an advertising department—they comprise all the possible lines of work that should be engaged in if a department is to concern itself with everything that affects the advertising campaign. The following list is submitted by Mr. William H. Ingersoll, of Robert H. Ingersoll & Brother, as inclusive of all the functional operations of an advertising department. The list does not show the organization of the department—in a small department one man may do all the things listed, while in a large department each thing may be done by a separate individual. The list is a chart of functions, not of persons; it is interesting because it shows the many kinds of work that the average advertising department must be organized to undertake.

Planning campaign:

- Studying the goods and services and their market
- Studying competition
- Studying opportunity
- Studying policy of appeal

Studying appropriation required to do the work desired

Studying the needs of the business

Studying to make the advertising "institutional" in flavor

Laying out appropriation:

Study and choice of suitable mediums by principal classes:

Newspapers	{	General
Magazines		Technical
		Class
		Trade
		House organs, etc.
Display	{	Store windows
Mediums		Car cards
		Bill-boards
		Painted signs
		Painted walls
		Theater curtains, etc.
Mail and	{	Lists
"Follow-Up"		Letters
		Circulars
		Catalogs, etc.

Sampling and demonstrations:

Distributing	{	House to house
		From stores

Novelties and specialties:

Compiling lists and data files as to rates, circulation, etc.,  
of mediums to be considered

Cooperating with sales and other departments:

Giving notice of plans

Supplying copies of advertisements, lists of mediums used,  
information as to how to extract "by-product" values,  
such as dealer cooperation, window display, etc.

Producing the advertising:

Probing for ideas

Designing advertisements

**Writing copy for:**

Advertisements

Catalogs

Booklets

Multiple letters, etc.

Originating illustrations, procuring photos, drawings, etc.

**Ordering:**Space and insertion of advertisements in publications  
chosen

Printed matter

Signs

Cards

Display advertising, etc.

Procuring estimates

Keeping cost records

**Checking:**Delivery of advertising ordered, insertion and space in  
publications, on bill-boards, etc.

Bills for advertising

**Record keeping:**

Records of all advertising ordered, by classes, times, etc.

Amounts spent by classes of medium

Results of each expenditure

Files of all advertisements run

Records of mailings

Records of mediums used

Indexing of data and files

**Stock keeping:**Inventory system with automatic reminder to avoid unin-  
tentional shortage

Storage of printed matter

Stationery, department's forms, etc.

**Filing:**

Records of department

Customers' and prospective customers' lists

- Correspondence
- Photographs
- Drawings
- Engravings
- Electrotypes
- Suggestive advertisements, booklets, letters, etc.
- Competitors' literature
- Reference books
- Clippings
- "Tickler" system items
- Data

Corresponding:

- Routine correspondence of department
- Following up inquiries

Charging system:

- Samples, etc., loaned artists and photographers
- Drawings and photos sent to engravers
- Engravings, etc., sent to publishers
- Books, records, copy, etc., loaned to other departments
- Time or service rendered to other departments

Disseminating current information:

- Sending copies of papers, as they come out, to executives to note appearance, positions, etc.
- Copies of circulars, form letters, etc., to list of interested people

Supplying equipment:

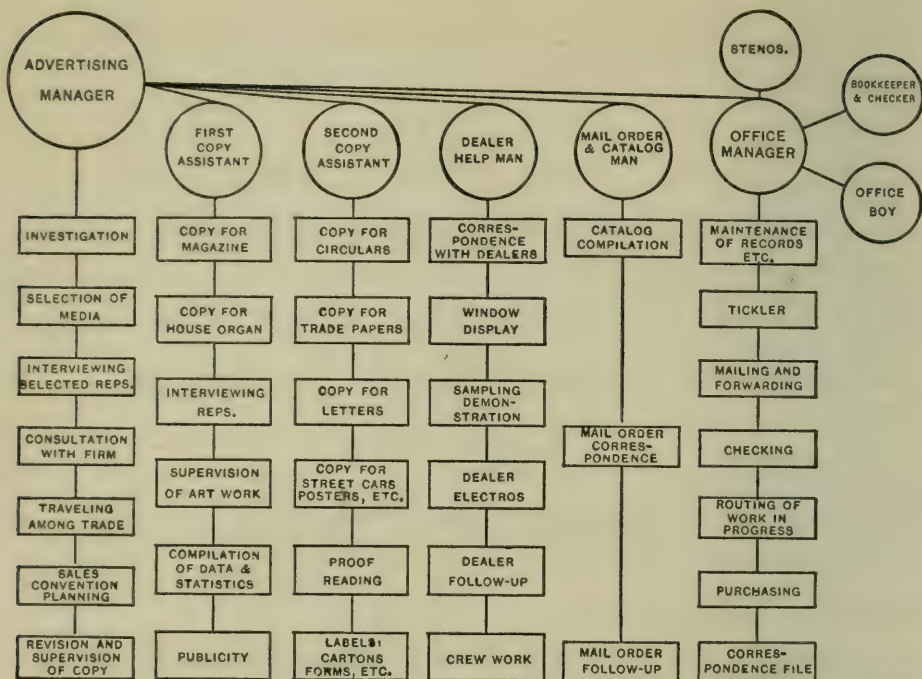

- Filing cabinets
- Forms

Multigraphs

- Addressing machines
- Folding machines, etc.

Maintaining its organized form:

- Standard practice system
- Routine instructions kept up-to-date

MARKETING DEPARTMENT ORGANIZATION OF ROBERT H. INGERSOLL &amp; BRO.

5. *Systems of organization.*—There are probably as many different kinds of advertising departments as there are advertisers. Each has its own organization particularly adapted to accomplish the work desired. The advertising department of the Burroughs Adding Machine Company consists of 175 people. The advertising department of Sears, Roebuck & Company consists of 1,300 people. The advertising department of the International Harvester Company consists of forty-three people in the main office and 140 people in the different territories. Some of these departments are managed by one executive who O. K.'s all activities and every piece of copy that goes out, while others are conducted by committees, and all final decisions are made in conference.

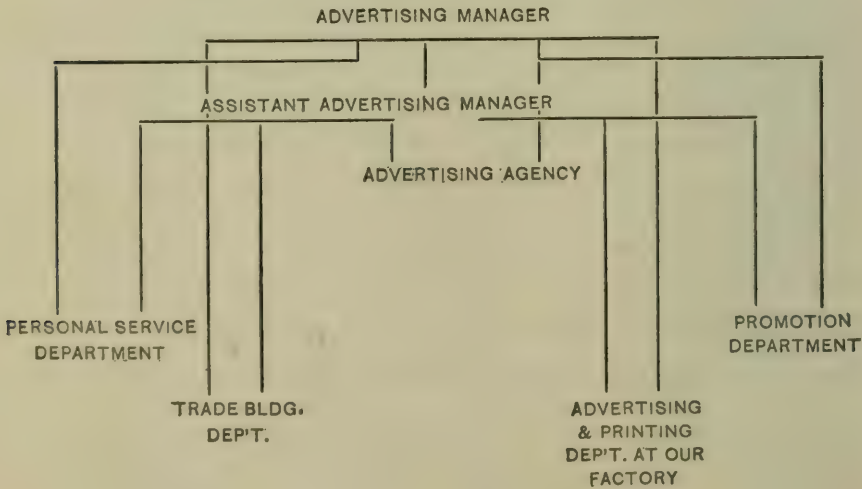

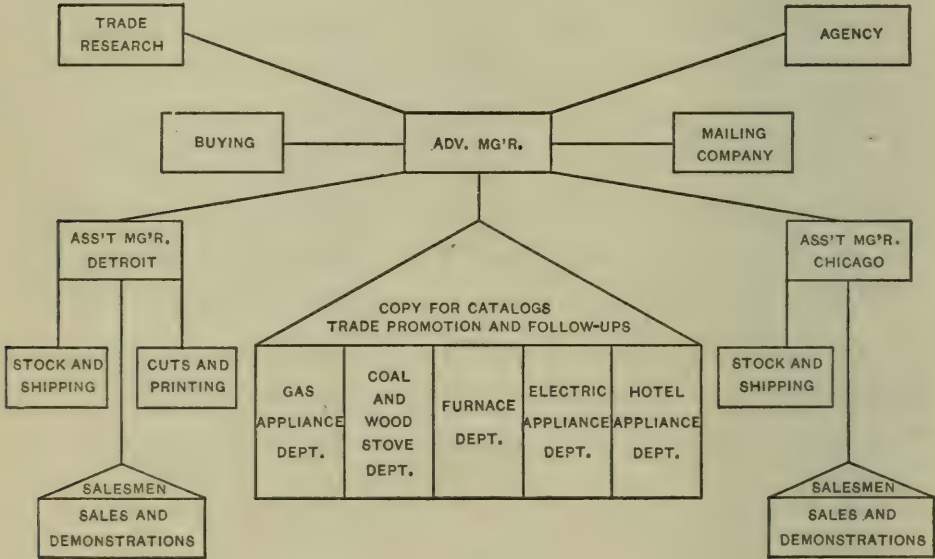

On the following page three charts are reproduced from *Printers' Ink*, showing the detailed organization of different advertising departments. The method of organization must always be adapted to the particular requirements of the business that the advertising department serves.

6. *A large advertising department.*—To indicate the method of adapting advertising department organizations to the needs and peculiarities of the business, we have chosen a large and a small advertising department for consideration. The Burroughs Adding Machine Company is an extensive advertiser and uses advertising in a great variety of ways to help its salesmen. Its advertising, therefore, is intensively developed. Mr. Edward A. Walton, of the Burroughs Company, describes the department as follows:

Our advertising department is organized not on the one cylinder plan but as closely as possible on a twenty cylinder plan. It is our idea to make the advertising department of ever-increasing value to the field force and the company, developing each man to his utmost capacity for all round advertising service. Every one of the twenty creative men is a conferee, and all the activities of the department are managed by conferences. The titular head of the department is just one of the conferees. Three men of the advertising agency are also full members of the conference. Strictly speaking, there are several conferences. The Senior Conference consists of four of the oldest men in point of service. These four men meet every day to consider suggestions from all sources and decide what work shall be done. Each Senior may subdivide his work among any

ADVERTISING CAMPAIGNS

of the Juniors of the department. Thus each Junior works at times with each Senior. Junior Conferences are held often by Seniors to consider copy, and the offer of a piece of copy thus gets the criticisms and suggestions of these conferees. Once a month there is a full conference of the department with the advertising agency, at which every phase of the work is considered.

We have in creative work twenty men; in clerical work connected with the creative men, six men; in record work—that is, taking care of our prospect files, addressing and sending out advertising matter—109 people; in our printing department, which is now doing about one-half of our printing, thirty-three people; our stock department, which takes care of our stock of advertising matter, stationery, and printed matter for the home offices and branches, five people; buying printed matter, engraving, and art work, two men; a total of 175 people. The work of the creative men is roughly divided into: A. Research: that is, studying in the office and in the field how Burroughs machines are used in various lines of business on various sorts of work, and putting this knowledge into printed form. B. Publicity: advertising in popular, business, and banking publications. C. Direct mail advertising. D. Answering inquiries. E. Direct advertising, consisting of writing articles for publication in all sorts of house organs and class publications, helping to show the business readers of these publications how they can know more about their business, and stimulating a desire for this knowledge.

7. *A small advertising department.*—A much more simple organization is that of the National Veneer Products Company, makers of Indestructo trunks. Mr. Charles R. Stevenson, at one time general manager of the company, describes the department:

Our national advertising is handled thru our agency who prepare the copy subject to the writer's O.K., and place it

in accordance with the schedule agreed on between us at the beginning of the year. The inquiries received as a result of this advertising are handled by two of our stenographers who send out a carefully prepared form letter with the necessary literature. The names are entered on cards and filed for follow-up work. A series of four letters in all are sent to each prospect. The record of the inquiry is sent to the dealer in the town where the inquirer resides, with a return card inclosed in order that we may be advised what action has been taken in regard to the inquiry. Dealers' inquiries are handled in the same way, another series of letters being used.

From time to time we get out folders, hanging signs, window displays, etc., which are generally designed and ordered by the writer. Samples of these are then sent to our dealers and placed in the hands of our salesmen. As requests for these materials come in from our dealers, the order is made out, which is sent to our printer, who imprints the folder, or whatever it is, forwards it to the dealer, sending us a memorandum to that effect. We then send out a form letter to the dealers advising them that the advertising matter has been forwarded and asking them to acknowledge receipt. From time to time we get out catalogs, broadsides, folders, etc., which we send to our list of dealers. These are addressed by the two stenographers in the department from our carefully maintained list of dealers.

So you see our advertising department really consists of the writer and two girls who do the detail work for him.

8. *Territorial advertising departments.*—Some large organizations maintain an advertising department at the home office, and in addition, separate departments in each of the branch offices or territorial districts. The men in the branch advertising departments work closely in cooperation with the home office, and usually are responsible to it. Their work is

chiefly to study local trade conditions and to prepare newspaper and circular advertising particularly adapted to these conditions.

The advertising department of the National Lead Company is organized in this way; the International Harvester Company also follows this plan; the Multi-graph Sales Company and the Burroughs Adding Machine Company introduced territorial advertising departments in 1916 after thoro investigations of the opportunities offered by such a plan. In large organizations in which many campaigns of varying natures are being pushed at the same time, and in which a close touch with the sales force is necessary, the advantages of the territorial method of organizing the advertising department are great.

9. *Cooperation with sales department.*—We have said that sometimes a single individual is in charge both of advertising and of the salesmen. This, perhaps, is the ideal method of obtaining cooperation between selling and advertising, but it is an ideal that is not as yet often realized. Ordinarily one of the real problems of the advertising manager is to develop plans which will insure the salesmen's cooperation with the advertising, just as the sales manager too often finds the advertising manager lacking in appreciation of sales problems and sales values. There should be no lack of harmony between the salesmen and the advertising. Advertising is merely one of the factors in selling, and it cannot be properly conducted unless selling methods and selling problems

are constantly in the advertiser's mind. Mr. L. S. Hamilton, of the National Tube Company, says, "After a number of years of experience, I have found one thing, namely, that the big thing in advertising isn't copy and it isn't style of type; neither is it cuts or booklets or anything of that kind. The success or failure of any advertising department rests on its ability to connect up with the sales idea."

Jealousies sometimes arise between sales managers and advertising managers because of inadequate conception of the close connection of their activities and because of the desire of one or the other to get personal credit for all that is accomplished in the promotion of sales. The advertising manager should keep the sales department closely in touch with all that he is doing and planning to do, and the sales department should give him all the information he needs, and should work in the closest harmony with him. Neither department should plan a new campaign by itself; new plans should be the result of conference in which the dovetailing functions of advertising and salesmanship are clearly recognized.

A manufacturer recently spent \$5,000 in one month in a carefully planned localized campaign. When the campaign was being planned, the advertising agent asked about the sales force, and was told that the manufacturer had six well-trained salesmen familiar with the trade and constantly at work. The advertising manager reported that he had carefully outlined

the campaign to the salesmen and that each understood his part.

Before the campaign was a week old the agent became alarmed at the meager sales. On investigation, he found the sales force of six had dwindled to two, that the salesmen were working on a flat commission basis, and that, instead of being well-trained, efficient men, they were what might be called transient salesmen. The public was being familiarized with the product, but no one was selling the dealers. Two letters had been sent to dealers, but no response had been received. What was to be done? Money was being spent at the rate of \$200 a day to raise the plums, yet there was no one to pick them. Nearly 2,000 dealers had to be sold at once, altho the agent had been led to believe they had all been seen before the campaign commenced. In desperation the agent, stepping in and assuming charge of the selling as well as the advertising, put a corps of girls at telephones and instructed them to call up the 2,000 dealers. This was a desperate and almost unheard-of way of attempting to obtain distribution; but, as there was no time then to train new salesmen, as the girls' voices were more pleasant and less expensive than the men's, and as the girls could be trained for telephone solicitations in short order, it seemed the only way to save the day. The results were better than was thought possible. The advertising had been so effective that a mere mention of the proposition to the dealers se-

cured more than a twenty per cent response. If this could be done by girls over the telephone, it is reasonable to suppose that three or four times the number of orders would have been secured by a sufficiently large and well-trained force of salesmen, and this result could have been obtained readily had the sales department cooperated with the advertising department.

10. *Obtaining first-hand information in the field.*—While some advertising managers depend entirely on the sales department and on conferences with salesmen for their knowledge of the attitude of consumers and dealers, it is becoming more and more customary for advertising managers to travel thru typical territories and obtain first-hand information about conditions with which they must be familiar if they are to do their work properly. The advertising manager, to get a clear grasp of conditions, sometimes finds it advisable to slip away for awhile from his office and do detective work. He may go out and represent himself as a salesman in order to get a clear idea of the arguments and excuses for not buying which constantly confront the salesman. He may ask of the dealer the privilege of going behind the counter and selling to customers, that he may obtain a clearer idea of the attitude of the typical consumer.

11. *The advertising department and the advertising agency.*—In the next chapter we are to discuss the functions of the advertising agency and its relation to the advertising department of its clients, but it is proper here to mention the much-discussed problem of

the advisability of doing without an advertising department entirely when an agency's services are used. Business men often ask the question, "If I can get an advertising agency to write and place my advertising, and if the services of the agency are paid for by the publisher, why do I need an advertising manager or an advertising department?" A large national advertiser spending in excess of a million dollars a year and employing about seventy-five people in his advertising department, turned this department over, a few years ago, to his advertising agency. While the department was conducted on the premises of the manufacturer, the employes were all hired, paid and supervised by the advertising agent. The plan was given a fair test. It was found impracticable. The advertising agent lost the account, and the advertiser found that it was necessary to re-establish an advertising department responsible to him and not responsible to the agent.

As we have already shown in this chapter, an advertising department must have definite, concrete functions of its own. It must be constantly in touch with the sales force. It must be responsible for the records and the detail of following up inquiries. It must prepare literature for dealers and for consumers. It must be a distinct and definite working cog in the machinery of the business itself. No matter how important the services of the advertising agency may be, an advertiser cannot expect to take full advantage of those services without people in his own organiza-

tion to do the many things for his business that an outsider, even when he is well informed and eager to serve, cannot be expected to do so well.

### REVIEW

Why is it dangerous to have more than one final judge of advertising in a business? Who should he be?

To what extent should the advertising manager's decisions regarding an advertising campaign be subject to approval by a superior?

In the business with which you are most familiar is there complete cooperation between the salesmen and the advertising department? If not, how could this cooperation be obtained?

Is the advertising department in your business so carefully organized that you can make a chart of it? Difficulty in charting an organization usually indicates looseness of structure; i.e., absence of clear lines of responsibility and authority.

What mental and moral qualities should an advertising manager possess? Do you possess them? Could you develop them?

## CHAPTER VII

### THE ADVERTISING AGENCY

1. *What an advertising agency is.*—In the broadest use of the term, an advertising agency is an organization of merchandising and advertising experts who assist business houses in planning and carrying out advertising and sales campaigns. The advertising agent is a professional man. He resembles a physician in that his training and experience enable him to diagnose business troubles and to prescribe remedial measures. He resembles a lawyer in that he outlines a plan of campaign for his client and then pleads his client's case before the court of the people. His organization is a store-house of information regarding the pulling power of different advertising mediums, different copy, and different merchandising methods; he is expected to have all advertising principles and practices at his finger tips, and, after careful study, to be able to prescribe for any set of conditions the marketing methods that will bring the best results.

2. *What an advertising agency does.*—Advertising agencies differ greatly in their activities. Some do many things; some do only a few. Some concern themselves with all phases of a client's marketing problems; others confine their efforts to advertising

alone. An agency that is completely organized to give advice regarding all phases of the distribution of a client's products and to handle as many details of his entire sales campaign as he may wish to leave to the agency, ordinarily is equipped to do the following things:

First, the agency makes a careful study of the thing to be sold—its quality, as determined both by technical and by practical tests, the conditions under which it is manufactured, the sources of raw material, plant capacity, labor supply and costs of production; the capital of the business and the amount that can properly be invested in selling activity; the trade name and the trade-mark, with suggestions for changes if changes are desirable; the package, with particular reference to advertising value and to convenience in handling; and the selling points. It then makes an equally careful study of the market and the nature of the demand, finding out who the people are toward whom the sales effort should be directed, where they live, how they live, when they buy, how they buy, how much they will buy and from whom they buy, with an intensive investigation of competition in all its phases. Next the agency studies the sales channels used by its client or that might be used by him, basing its recommendations on complete knowledge of the relations among manufacturers, jobbers, retailers and other middlemen, and determining for each particular product the best channels of trade from manufacturer to consumer. Following this the agency turns its attention to the price

at which the product is to be sold and the sales policies to be followed—including such problems as credit, discounts, price maintenance, guarantees and service.

After all this preliminary investigation and study, the completely equipped agency will, if the client wishes, aid in the organization or reorganization of the sales force, giving advice and active help in all the many problems of sales management. Coincident with this, the agency studies the copy problems of the advertiser, and writes, or assists in writing, the advertisements, obtains illustrations for them, attends to having the finished advertisements electrotyped, selects the mediums to be used, sends the copy or the electrotyped plates to the periodicals selected, makes arrangements for all out-door and street-car advertising and checks the advertisements as they appear. Then come the important problems of coordinating the advertising with the work of the salesmen, or getting distribution among dealers and inducing them to cooperate in the campaign. This last problem involves the preparation of all sorts of dealer helps—store signs, window displays, circulars, novelties, etc. The agency will also prepare direct advertising both to dealers and consumers, in the form of catalogs, house organs, sales letters, mailing cards and other kinds of direct sales helps. Finally, the agency either keeps careful records of the results of all the sales producing activity, or it advises and helps the client in keeping such records.

3. *Variations in agency service.*—As has been said,

all agencies do not do all of these things. Some are specialists in certain lines of advertising; others are mere counselors, without machinery for putting their suggested plans into effect. An agency's activities may go beyond the planning of advertising campaigns and the preparing of advertisements, or they may stop short of these things. All agencies that are worthy the name, however, base their recommendations on intensive study of a client's marketing difficulties in all their aspects, and then, to the extent that their equipment permits, they help advertisers to solve their publicity problems, to establish advertising policies and to put those policies into effect.

It is estimated that over ninety-five per cent of all national advertising in the United States is placed thru advertising agents, and a very considerable part of the local and territorial advertising is also prepared and handled in this way.

4. *History of the advertising agency.*—The first advertising agency was established in 1840 in Philadelphia, by V. B. Palmer. In 1899, there were forty-one advertising agents. Today there are approximately 300 "recognized" agencies, while there are probably 150 other concerns attempting to conduct an agency business, but not receiving what is called "recognition" from any publishers' association. In addition, there are probably a thousand other individuals and organizations, who in limited fields of merchandising, copy and art assist advertisers with their campaigns.

In the beginning, the business of the advertising

agent was very simple. He obtained permission to represent a list of newspapers, and called on prospective advertisers persuading them to "place their card" in a number of these newspapers. In those days, the papers for the most part had no established rates; the agent would make a rate to suit himself, paying the publisher as small a proportion of the amount collected as he could persuade him to take. If the advertiser neglected to pay the agent, the agent was not held responsible for the space used.

In the early days, the basis of charge for advertising space was the "square." The publisher would divide a column into so many squares in which would be placed advertising "cards." The copy was seldom changed. In fact, some advertisements were used without change for from twenty to thirty years. The reader may recall "squares" used for long terms of years without substantial change of copy by Royal Baking Powder and Lea & Perrins Worcestershire Sauce.

In 1865, George P. Rowell established himself as an advertising agent, and it was he who introduced the plan of buying from the publishers a column or more of space in a list of 100 newspapers, dividing this into inch squares, taking full responsibility for payment, and on his own terms selling the inch squares to advertisers on annual contract. Some of this retailing of space was continued up to as late as the beginning of the twentieth century. A few people still believe that an agency is a dealer and has on hand

contracts for space which he must use within a specified time and which he is, therefore, willing to sell at reduced rates. Advertising agents no longer operate in this way. The modern agency represents no particular mediums. It represents primarily its clients' interest, and places advertisements only in those mediums that can do the most to aid in the sale of its clients' goods.

While the advertising agent has guaranteed payment for the space used by his clients ever since the time of the Civil War, and has written copy and placed advertising from the beginning, it was not until about 1900 that agencies established their own art departments and began to render the general merchandising service that many of them render today.

5. *Publishers' representatives.*—The early agent, of whom Mr. Rowell was a type, in buying space in selected papers and selling only that space, exercised a function of the modern "publisher's representative." A publisher's representative is the appointed representative of one or more publishers. It is his duty, in a certain territory, to call on advertising agents and on advertisers, presenting the merits of the publications he represents, and endeavoring to induce agents and their clients to place their advertisements in those publications.

6. *Agency's service to publisher.*—Altho the publishers of some classes of periodicals do not "recognize" advertising agencies, most publishers welcome

the services of the agent and are glad to have him act as a valuable middleman between themselves and their advertisers. One reason for this is that publishers cannot keep as closely in touch with their advertisers as the agency can; also, it is much easier for a publisher to handle the accounts of a few agents than it would be to carry the accounts of many individual advertisers. One publisher finds that ninety per cent of the accounts he receives from the agencies are paid promptly every month, while only forty-eight per cent of the accounts he receives direct from advertisers are paid in this way.

The agency frequently saves the publisher from loss. As the agent's success depends on the success of his clients, he keeps advertisements out of publications where they would be likely to be unproductive. This keeps down the publishers' advertising death rate. So highly do most publications regard the services of the agent that, when a publisher is approached by a new advertiser who is not represented by an agent, the publisher will frequently send him to one, just as the court appoints an attorney for a defendant who has no legal representative to plead for him.

The chief service of the advertising agent to the publisher, however, is his ability to create business. The good advertising agency is one of the real constructive forces in American business. The agent is always on the lookout for new inventions and for new organizations with possibilities of growth. He

must, of necessity, be optimistic; he must have vision. He continually preaches advertising and its possibilities. He studies it in all its forms; he believes in it and he impresses his belief upon others. Certainly a large proportion of the advertising carried by magazines and newspapers would never appear were it not for the work of the agent in seeking out possible advertisers, studying their business, smoothing out difficulties, "selling" the idea of advertising to the hesitating manufacturer, and finally carrying the great burden of the actual details of the advertising campaign.

7. *Agency's service to advertisers.*—The advertising agent, as has already been demonstrated, is in a position to do many things for an advertiser. Agents speak of "developing" an account. For example, an advertising agent will sometimes render service and advice for a year or two before any advertising is placed. He may find many things in the organization needing correction before proper advantage may be taken of the advertising. Perhaps the advertiser's package is not sufficiently distinctive. Perhaps his plan of selling is not adaptable to larger fields. Whatever it is in the organization that is an obstacle to its large success, the province of the advertising agent is to find the trouble and to tell the advertiser how to remedy it.

The agent is constantly pointing to larger things. His province is similar to that of the wife of a successful man. She encourages him; she inspires him.

She helps him with the little things. Her greatest ambition is that he succeed. But, when he does succeed, she must not claim credit for his accomplishments. His very success depends on the world's recognition of his having done it himself. Many agents have lost accounts which they have developed because of too much "crowing."

The advertising agency's first function is that of an adviser. Most agents do not accept competing accounts. They stake their success on the success of the advertiser, and help him fight his battles with his competitors. Just as in the case of the doctor and the lawyer, the more frank one is with his adviser the more intelligent is the advice he receives.

The story is told of a manufacturer with a new product for which he was willing to spend \$100,000 in advertising. He called on an agent and asked for advice regarding the best way to spend the money. The agent investigated the product, the possible demand and the competition. He told the manufacturer that in his opinion the investment would not be a profitable one and advised him not to advertise. The manufacturer went to another agent and received the same advice. In all he went to six agencies, ready to place his \$100,000 in their hands, and in each case was told to keep his money.

While there are some advertisers who still place their business direct with publishers, most advertisers prefer to employ an agent, and most publishers prefer to have advertisements come to them thru agents.

For a time the patent medicine advertisers, the liquor advertisers and a few of the railroads felt that by placing their advertisements direct with the publishers, they were in a better position to influence the editorial columns and to censor news and editorial matter that might hurt their businesses. As the publishers have become stronger in their determination not to let the advertising columns influence the editorial columns, and as the agencies have become stronger in the volume of business given to the publishers, advertisers have realized that if their claims for or against editorial discrimination are just, the influence of the agency on the publisher is greater than the influence of any individual advertiser could be.

8. *The outsider's viewpoint.*—The advice rendered by the agent is valuable, partly because it is based on his own experience, his records of the experiences of others and his knowledge of merchandising methods. But it is valuable also because the agent brings to any advertiser's problems the outsider's viewpoint. It is said that a doctor cannot diagnose his own case. Similarly, a manufacturer becomes involved in the details of his business and in his fight against competition, and it is hard for him to see his business as a part of the great distributive system. The advertising manager represents the business from the inside. The advertising agent represents the public as related to that business. The manufacturer considers his product as something to sell.

The agent considers the product as something to buy.

9. *How an agency works.*—Every advertising agency has, at least in theory, three main departments:

1. A soliciting or promoting department to develop business

2. A creative department to prepare advertisements

3. A buying or rate department to keep in touch with advertising mediums.

Of late years advertising agencies have avoided the word "soliciting." Soliciting departments are now more often spoken of as "service" departments. The men who try to interest advertisers in the services offered by the agencies that employ them should be much more than mere solicitors. Most of them are men of experience and judgment—men who can collect data, study the business of a prospective client, help him to prepare his business for advertising, advise him with respect to merchandising plans, give to the copy writers in the agency the information that they need, sometimes write much of the copy themselves, and in all respects act as helpful points of contact between the agency and its clients.

An extensive advertising agency might have the following departments:

1. Soliciting or service department
2. Plan department
3. Merchandising investigators
4. Copy department

5. Art department
6. Typographical department
7. A handling department to deal with engravers and printers
8. Forwarding department
9. Checking department
10. Auditing and invoicing department.

10. *Relation of agency to advertiser.*—There has been much discussion about the division of functions between the advertising agent and the advertiser's own advertising department. In some cases, as was shown in the last chapter, advertisers have attempted to get along without advertising departments of their own, making the agency responsible for all details of the campaign. In other cases, the advertiser has an extensive advertising department, and uses the agency chiefly for counsel to aid in the copy writing and to place the advertisements in publications. Between these two extremes there is every shade of variation in practice. In theory, the advertising manager of a business and the advertising agent with whom he works should confer on all important matters, the advertising manager bringing to the conference the facts regarding the business, its goods, its personnel and its policies, and the agent bringing the outsider's viewpoint with a detailed knowledge of advertising principles and mediums and a fund of data regarding merchandising plans and methods.

If the advertising manager is skilled in copy writing, he and his staff can and should produce many

of the actual advertisements, leaving, perhaps, the details of the merchandising plan to the agency; or, if the advertising manager and his organization are best prepared to produce broad marketing schemes, the production of advertisements may be left largely to the agency. In any case the agent's plans and his suggested methods of carrying them out are subject to the approval of the advertising manager or of some other responsible member of the advertiser's organization. A spirit of mutual helpfulness and a common and unselfish desire really to advance the interests of the advertiser will do more to bring the advertising manager and the agent into helpful co-operation than any amount of cut-and-dried rules defining their respective functions.

11. *The advertising agent's compensation.*—In a sense the advertising agency is the middleman in the advertising business. He does not buy space in large quantities to resell in smaller quantities but he does sell the publisher's commodity—space. For this service he is paid by the publisher. The ordinary service rendered by the agent—study of the client's business, writing copy, placing copy, etc.—costs the advertiser nothing. That is, the advertiser could not buy space any more cheaply if he performed this service for himself, than he can buy it and also utilize the services of the agency. The space used by the advertiser is billed to him by the agent at the publisher's card rates. The publisher bills the agent for the space used by his client, at the card rate less a certain

discount, and it is this discount that represents the agent's gross compensation. Out of it he has to pay all the expenses of conducting his agency, keeping what remains as profit. The discount allowed by the majority of magazine publishers is thirteen per cent. That is, if an advertiser uses one thousand dollars' worth of space in a publication, the agent sends him a bill for \$1,000. The publisher, in turn, bills the agent for \$1,000 less 13 per cent, leaving \$130 as the agent's gross compensation. Some agencies in such a case, instead of billing the advertiser for the card rate, would send a bill for the net cost to the agency, \$870, plus 15 per cent, which is approximately \$1,000—thirteen per cent of the gross charge being about the same thing as fifteen per cent of the net.

Different classes of mediums often grant the agency different commissions. Most newspapers grant fifteen per cent with an additional two per cent for cash, altho some allow only a ten per cent commission. The organizations controlling billboards grant sixteen and two-thirds per cent. Some trade papers allow ten per cent. Until 1914, the standard basis of agency commission among magazines was ten per cent, with an additional five per cent for cash. This cash discount the agent was supposed to pass on to his clients when they discounted their bills. It was found, however, that the agency could not give sufficient service on the ten per cent basis, and that the agency, to make money, had to withhold part of the cash discount. To standardize the practice, as

has been said, most magazines have now established thirteen per cent as the regular agency commission, and the exact amount of this discount for cash given to the agency by the publisher is in time given to the advertiser for the same prompt payment. This is usually three per cent in the agent's net.

While to one unfamiliar to the advertising business, the agency's commission may appear to be in a very involved condition; as a matter of fact it is less involved and rates are more rigidly adhered to than in almost any other class of business. An agent who cuts rates is regarded as an outlaw, and he may at any moment lose recognition from the publishers and will not be allowed membership (or will be expelled from membership) in any of the agents' associations.

The agency's commission, allowed him by those who control advertising mediums, pays for the ordinary agency service. Many agencies make an additional "service charge" to advertisers when the services rendered involve unusual outlays of money. An elaborate market investigation, for instance, preceding a necessarily small investment in space, may be paid for by the advertiser. The advertiser also pays for the work of artists, for the electrotyped plates of advertisements sent to mediums, and for transportation charges on all advertising matter and cuts. These matters, of course, are all agreed upon between the agent and the advertiser before the agent undertakes the account.

12. *The meaning of "recognition."*—Several times

in the preceding paragraphs we have referred to "recognition" of agencies by publishers. An advertising agency is "recognized" when the publisher grants a commission for advertising received from the agency. As advertising agencies began to increase in number and to demand of publishers statements of circulation and fixed rates for space, the publishers found it advisable to organize associations to investigate the standing and responsibility of the agents in order that the publishers might be protected from the unscrupulous and the irresponsible. The newspapers have performed this function thru the American Newspaper Publishers' Association, the magazines thru the Quoin Club, and the farm journals thru the Agricultural Publishers' Association. There are some publishers who will not grant recognition until they, individually, have made a special contract with the agent. This is becoming the general custom among the magazines. Since 1915 the Quoin Club has no longer "recognized"; it has "recommended." Without recommendation the magazine publisher will not consider an application for commission from an agent. When recommendation is obtained the publisher uses his own discretion as to recognition.

These associations demand of the advertising agent a satisfactory financial statement, a record of the past experience and accomplishments of the individuals in charge of the agency, an assurance that the agency will not rebate any of its commissions to the adver-

tisers, a list of the accounts, and in some cases a statement of the volume of business which the agency is prepared to place. The number of accounts necessary to secure recognition varies. While the associations generally adhere to the rule that an agency must have at least three accounts, in some cases a publisher insists upon at least three accounts placed in his publication; and all now demand that the agency be entirely free, on a financial basis, from the advertiser. In the old days, some large advertisers were known to finance advertising agencies of their own, to secure the commission from the publishers; just as today we find large retailers or a combination of retailers financing a wholesale business in order to save the wholesaler's profit for themselves.

13. *How an agency secures recognition.*—With so many organizations from which an agency must obtain recognition before it can do business profitably, it is a difficult matter for the new agency to secure satisfactory recognition. When one considers the credit risk the publishers must take and the fact that an agency may be conducted with a very small amount of capital, it is right that an agency's ability should be carefully tested before recognition is granted.

From the advertiser's viewpoint, it is important that the advertising agent with whom he deals should be recognized by all classes of mediums. This arises from the fact that the agent's compensation comes chiefly in the form of commissions from publishers. If he were granted a commission by one publisher

and not by another, he might be suspected of putting his own interests before his client's if he were to select the first publisher's periodical, and not the second's, as a proper medium for his client's advertisements. That most agents, however, do not let the matter of commissions influence their advice to their clients is indicated by the many cases in which conscientious advertising agencies have placed large volumes of business with certain publishers who did not grant them recognition. Some accounts, in this way, are carried by the agent at an actual loss.

To insure to the agent proper compensation from all mediums that his clients' campaigns may require, as well as to avoid other difficulties in the methods of recognition in vogue in the past, a new plan of agency recognition was proposed by the Affiliation of Advertising Agency Associations at the 1916 Convention of the Associated Advertising Clubs of the World. The plan comprehends joint recognition by all mediums, the recognition to be granted by a central body, one representative from each medium and one from the Agents' Association. This will give the new agency an opportunity to start on an equal basis with respect to all mediums, and will give each medium and the agents themselves an equal voice in the recognition of others to their ranks.

The advertising agencies are now formed into associations—the New York Advertising Agents' Association, the Western Advertising Agents' Association, the Philadelphia Advertising Agents'

Association, the Boston Advertising Agents' Association and the Twin City Advertising Agents' Association. These associations comprise in their membership all the better agencies, and membership in them is usually considered as final recognition.

The new plan will do much to clear up the agency situation, and, while it may not be easier under it to secure recognition for an agency, it certainly will allow those securing recognition to do business on a more satisfactory basis; it should aid publishers, advertisers and agencies alike.

#### REVIEW

Why and how should an advertiser use an advertising agent?

How does the advertising agent help the publisher?

Is the advertising agent the agent of the advertiser or of the publisher?

Should an advertising agent handle competing accounts? Why?

How will the new plan for recognizing agents be of benefit to all factors in advertising?

Is it logical for the pay of the advertising agent to be based on the amount and value of the space used by a client? Do the time and thought spent on a campaign vary directly with amount of space used? Can you think of any other practicable method of payment?

## CHAPTER VIII

### ADVERTISING MEDIUMS

1. *Place of the medium in the campaign.*—We have discussed the demand for the product, the possible market, the competition and the men who conduct the advertising campaign. Our next question is: How may the advertisements be brought before the public? What instrument or instruments are we to use to send our advertising message to the greatest number of potential customers?

In advertising, as in war, the men who direct the forces are constantly confronted by the problem of choosing the best means of carrying on the advertising campaign. What mediums are to be used? For any given product, designed to reach a given class of people, what means can best serve the advertiser in carrying his message to the people he wants to reach—magazines, newspapers, street cars, circular letters, catalogs, sampling, house organs, painted signs, electrical displays, demonstrations and so on to the end of a long list? We are to find that there are three main divisions of mediums, just as there are three main divisions of the forces available for military warfare, and that these three divisions divide and subdivide into so many groups that the problem of

selecting the right mediums is as difficult as it is important.

2. *One medium alone seldom sufficient.*—In war few campaigns have succeeded by the use of one branch of the service alone. Napoleon placed too much confidence in his artillery, and this is said to have been one of the causes of his fall at Waterloo. So in advertising, few successes are attributable to the use of only one class of mediums. Campbell's Soups were first advertised in the street-cars, and for a long time this was the only class of advertising the company used. Today, however, this great advertiser is depending on magazine advertising for the greater proportion of its success, and it is also using newspaper advertising in many localities.

The choice of the mediums to be used is one of the most important problems of any advertising campaign.

3. *Advertising mediums defined.*—An advertising medium, in its broadest sense, is any vehicle which carries an advertising message, suggestion or impression. Everyone in business at some time in his career has had someone try to sell him something on the ground that "It will be a good 'ad' for you." The doctor and the lawyer, who are usually left alone by the advertising solicitor, are persuaded to buy expensive automobiles, fine homes and memberships in clubs on the pretext of advertising. The politician buys space in the program which the ladies of the church are going to use at their next fair. And the

business man—well, the business man often finds an assortment of advertising solicitors lined up in front of his office when he arrives at work in the morning, and another equally formidable array and with equally plausible propositions awaiting him on his return from luncheon.

Mr. M. W. Savage of the International Stock Food Company, owned Dan Patch, Minor Heir and other famous horses. The name of Dan Patch was inseparable from the International Stock Food Company, and wherever he appeared, he was an advertisement for his owner and his owner's business.

4. *How mediums are selected.*—At the outset of a study of mediums the advertiser should clearly understand that *all mediums are good*. They are not all good for all purposes or for all advertisers, but each one for some particular purpose and in some particular way can perform a useful service for some advertiser. There are many rival claims of superiority among the people who try to induce advertisers to use different classes of mediums. Some magazine men try to convince advertisers that magazines as a class are better mediums than newspapers, and then the newspaper publishers set up counter claims of superiority for their publications. Billboards are said to be better than street-car cards, and street-car cards are said to be better than billboards. And so the fruitless controversy goes on respecting all kinds of mediums. Such discussion is as futile as to debate the relative value to man of air and water.

One class of mediums is not better than another. It may be better for a certain purpose, and worse for another. The problem of the advertiser is, first, to find out definitely what purpose he wants to achieve—what people he wants to reach, what he wants them to do, how his product can best be made to appeal to them, how they live, earn, spend and play—and then to pick out, after unprejudiced consideration of all mediums, the ones that can best carry *his* message about *his* product to *his* market. The problem is individual for each advertiser.

5. *Three general classes of mediums.*—All advertising mediums may be divided into three classes:

a. *Direct mediums*—thru which the possible customer is reached directly by the advertiser, either by mail or by some other distributing agency fully controlled by the advertiser.

b. *Periodicals*—thru which the possible customer is reached by the introduction of a third party.

c. *Signs*—thru which the possible customer is reached by utilizing the habits of the public.

In the case of *direct mediums*, the circulation is entirely in the hands of the advertiser. He makes up his own list of possible customers and reaches them for the most part thru the mail. He may add a name or eliminate a name at will. He is in full control of all advertising mediums of this class.

When one buys space in a *periodical* he does not have full control of its circulation. The publisher comes to the advertiser and announces that he is dis-

tributing his publication regularly to a certain class of readers. He offers to introduce the advertiser to these readers thru space in his publication. He tells the advertiser the class of readers he can reach. The advertiser can pick and choose his publications, but he has no control over the circulation of these publications.

*Signs* include a wide variety of different kinds of mediums. Neither the advertiser nor the one who sells the space has full control of the circulation reached by signs. An electric sign may be placed at the corner of Broadway and Forty-Second Street in New York. Estimates, based on careful count, can be made of the number of people who will pass that point every twenty-four hours, but the advertiser cannot buy a definite circulation for the sign. It will vary from day to day and week to week according to the habits of the people. The second party in the advertising triangle, the possible customer, controls the circulation.

6. *Circulation*.—The circulation of any advertisement is, in its broadest sense, the number of individuals who may be expected to see it. The circulation of a medium is the number of people that it reaches. Just what should be considered in figuring the circulation of a magazine or newspaper, for instance, we are not here to discuss. At this point, however, it is important to emphasize the fact that circulation does not always or often mean the actual number of people who see an advertisement—it means the num-

ber who may be expected to see it. The user of direct mediums sends out 5,000 form letters. His circulation is 5,000. One thousand or more of his letters may go into the waste-baskets of recipients without being read. It is the advertiser's task to make his direct advertising so attractive in appearance that most or every one of his 5,000 circulation will really see and read his message. The user of periodicals may buy a circulation of 100,000. That is what he pays for. He does not necessarily, however, purchase 100,000 readers of his advertisement. Whether any or all of the people who make up the 100,000 circulation of his mediums see and read his advertisement depends on his ability to attract their attention and to arouse their interest. In other words, *circulation* and *readers* of an advertisement are two separate things. Circulation is a mechanical thing that can be bought. Readers cannot be bought; they must be persuaded:

Until recent years statements of circulation have been often unreliable. Some publishers refused to give any statements regarding circulation, and others were satisfied with round numbers that were obviously inaccurate. The sellers of space for signs made little effort to estimate the number of people who might see them, and even users of direct advertising bought lists of names with frequent disregard for their timeliness and value. Now, all this is changed. Sworn circulations are the order of the day. Circulation is a matter of careful investigation, and everyone—pub-

lishers, billboard people, companies controlling street-car space, advertisers and the government itself—is concerned with the circulation of advertising mediums. The United States Post Office Department demands sworn statements of circulation from newspapers, and the Audit Bureau of Circulation to which most periodical publishers, advertisers and agents belong, issues detailed analysis of circulation for its members. Other associations and individuals are rendering similar service. This is decidedly the day of known circulations.

7. *Amount spent in different advertising mediums.*  
—The following estimate shows relatively the amount of money spent annually in the United States in a few of the different advertising mediums. While these figures were prepared several years ago, they are to date the latest available estimates.

#### DIRECT MEDIUMS

Booklets, letters, catalogs and folders . . . . .	\$100,000,000
Novelties . . . . .	30,000,000
Demonstrations and sampling . . . . .	18,000,000
House organs . . . . .	7,000,000
Miscellaneous . . . . .	6,000,000
	<hr/>
	\$161,000,000

#### PERIODICALS

Newspapers . . . . .	\$250,000,000
Magazines . . . . .	60,000,000
Farm and mail-order magazines . . . . .	75,000,000
Theater programs . . . . .	5,000,000
	<hr/>
	\$390,000,000

## SIGNS

Bill posting .....	\$30,000,000
Out-door electric signs.....	25,000,000
Street-car advertising .....	10,000,000
	<hr/>
	\$65,000,000
Total .....	\$616,000,000

In volume of advertising the periodicals lead. Newspaper advertising alone, if these estimates are indicative of actual expenditures, represents about forty per cent of all advertising in all mediums, while the various kinds of magazine advertising form about twenty-two per cent of the whole.

8. *Letters*.—We are to list and consider briefly some of the more important kinds of *direct mediums*. The first is the letter. A letter written to one individual and sent only to him is properly not advertising at all. It is personal salesmanship, because presumably the personal characteristics of the recipient were appealed to when the letter was dictated. A letter that is duplicated, however, and that goes to a group of people, is properly called advertising, because it is an appeal to a group rather than to an individual.

9. *Sampling and demonstrating*.—In sampling or demonstrating, the actual thing to be sold is allowed to speak for itself. In a sense, sampling and demonstrating are a form of personal salesmanship rather than of advertising, because the article to be sold is usually put personally into the hands of the possible purchaser. Nevertheless, these publicity methods are

usually classed as advertising because every sample in a lot of ten thousand is usually distributed in exactly the same way as every other sample; the appeal is really a mass appeal, altho the samplers come into actual contact with individuals.

10. *Booklets*.—The next group of direct mediums includes booklets, leaflets and folders. Some advertising campaigns are built entirely on two direct mediums, sampling and either booklets, leaflets or folders. The booklet tells the story more completely than it can be told in a letter. In the booklet one can show illustrations, while this is difficult in a letter. The booklet is one step farther removed from the salesman. It has been said that every advertising campaign calls for at least one booklet. No letter, periodical or sign can tell the whole story.

11. *Catalogs*.—The next general group of direct advertising mediums consists of catalogs. The advertising of Sears, Roebuck & Company is confined to catalogs almost exclusively. In the beginning of the business this company was a large user of space in periodicals. The number of customers finally became so great, and the company obtained such direct connections with its patrons that all periodical advertising was discontinued, and the catalog is today the only kind of advertising used. The following explanation of his company's advertising policy was made by Mr. Richard W. Sears a few years before his death:

We have simply outgrown the circulation of mail-order journals, farm and religious papers, magazines, and similar

mediums, because long use of them to advertise our catalog has given the book a wider distribution than any periodicals we can use. What periodical has a circulation of 5,000,000 copies? Yet we put out that many catalogs a year. Every twenty-four hours 12,000 requests for the book come to us, and we are sending out, at the same time, later editions to people already on the mailing lists. There is no duplication in this circulation. We take every precaution to see that no person gets two copies of the catalog the same year. Every name and address to which a copy is sent is filed geographically and every request is compared with this file. When the business was new, we advertised the catalog persistently, but now we do not advertise it at all. Yet we send out nearly 100,000 copies every week. Of the requests that come seventy-five per cent are from people who have an old catalog. Only twenty-five per cent are new.

Matters have gone on to a stage where periodical advertising no longer pays us, because there are not enough new prospects left in the country to make advertising profitable.

We can't see how to spend more money profitably in periodicals. Our catalog tells our story so effectively that no amount of newspaper or magazine space could produce the same advertising effect.

Despite this condition in rural districts, when Sears, Roebuck & Company attempts to extend its field, as it has done in selling a special edition of the *Encyclopedia Britannica* or in establishing a new ladies' garment department under the patronage of Lady Duff Gordon, it is a most liberal user of both magazine and newspaper space. In such cases the mail-order house advertises to reach a new market which its catalog does not reach and in which its catalog alone does not carry sufficient prestige.

Few advertisers can rely solely on the catalog, be-

cause few of them have covered their field as intensively as the big mail-order houses. The catalog is usually a supplementary advertising medium, to aid the salesmen and to turn into orders inquiries produced by other kinds of advertising mediums.

12. *House organs*.—A house organ is a publication, usually in the form of a magazine or newspaper, issued by a business house in the interests of that house. It appears, ordinarily, at regular intervals, and, therefore, it might be thought of as a periodical instead of a direct medium. It is properly classified as a direct medium because, regardless of when it appears, its circulation is entirely in the control of the advertiser.

House organs are of many different kinds.

The house organ that acts as a direct advertising medium is the one that goes to dealers or to consumers. Many manufacturers publish more or less elaborate magazines, in the interest of their own business, which they send regularly to jobbers and retailers as well as to the traveling salesmen and clerks of these distributors. Other advertisers, dealing direct with consumers, send their sales story regularly to people who might be interested, in the form of magazines of varying degrees of pretentiousness. House organs are ordinarily used to back up the work of salesmen and the appeal of other kinds of advertising; very seldom are they used alone.

13. *Novelties*.—The next class of direct mediums is known as *novelties* or *specialties*. It consists of

calendars, pocketbooks, knives, paper weights and a large variety of other articles of more or less utility to the one to whom they are presented. America spends over \$30,000,000 annually in novelty advertising. Novelties are usually given away by the advertiser, altho sometimes the possible customer is asked to pay a nominal price for them. A novelty is ordinarily something that will be constantly before the recipient and which will, therefore, continually remind him of the advertiser. Another element of value is supposed to lie in the fact that the recipient of a novelty, if it is of any value, will feel a degree of gratitude to the advertiser, and will reciprocate by giving him his orders.

Some novelties have still another kind of value. They result in the good-will of the recipient, but they also act as signs to draw the attention of others. Nearly everyone has seen the watch charm in the form of a green pickle, given away by the manufacturer of Heinz pickles. This is valued by the man who wears it, and it also serves to advertise Heinz pickles to others. In the same class is the advertising umbrella and the advertising horse blanket. Probably the most effective advertising specialties are those that serve both as signs and as direct mediums.

## REVIEW

Fundamentally, how do the three main groups of advertising mediums differ?

For your business, which of the three main divisions of mediums seem to offer the greatest opportunities? Why?

What does an advertiser pay for when he buys "circulation"?

Under what circumstances can catalogs be profitably used as a sole advertising medium?

Could you use direct mediums in your business? If so, what kinds?

## CHAPTER IX

### ADVERTISING MEDIUMS (Continued)

1. *Periodicals*.—The second main division of advertising mediums, called periodicals or publications, may be subdivided into six general groups:

- |                                     |  |
|-------------------------------------|--|
| 1. Newspapers                       | 4. Trade, technical, and class publications  |
| 2. Magazines                        | 5. Foreign language publications             |
| 3. Farm and mail order publications | 6. Directories and miscellaneous periodicals |

2. *Newspapers*.—Newspapers as a class carry more advertising than any other one medium. They carried advertising before the modern magazine made its appearance, and they continue as exceedingly important advertising aids, not alone for the local dealer, but for the manufacturer as well. It is not possible accurately to define the terms *newspaper*, because the dividing line between some newspapers and some magazines is exceedingly indistinct. However, a description is as good as a definition for our purposes, and ordinarily a newspaper has certain characteristics which permit of its easy classification.

There are two outstanding characteristics. First, a newspaper is concerned chiefly with the printing of news—not the news of special trades or interests, but the general news of the community and the world. Second, a newspaper ordinarily serves a definite locality. It may have subscribers all over the country, but the bulk of its readers are found in the community in which it is published.

Newspapers may be classified in a variety of ways. Using the interval between issues as the basis of classification, we have dailies, weeklies, semi-weeklies and perhaps others. Few real newspapers are published less frequently than once a week. Another basis of classification gives morning, evening and Sunday papers. We are not now concerned with the sub-classifications. The important thing is that the newspaper is primarily a local medium, of undoubted value for the advertiser who wishes to reach intensively the buying public of a given community.

3. *Magazines*.—A magazine differs from a newspaper chiefly in that it is not primarily concerned with the printing of news. It may summarize the news (for example, *The Outlook*, *The Independent* and *The Literary Digest*), but its chief purpose is to comment on the news and to interpret it, or to instruct and amuse with fiction, essays and other forms of more or less permanent literature. Altho some magazines are published for a local clientele, most of them circulate rather widely in a state, a section, or thruout the entire country.

Magazines are variously classified. First, there are the weeklies, monthlies, quarterlies and annuals; some are published twice a week, others every two weeks and a very few at still other intervals. Magazines are also classified on the basis of their readers; for example, publications for men, for women, for children. A publication might be intended only for a particular group of people—those belonging to a certain religious denomination, for instance. Strictly speaking, such a publication might be a magazine, even with this limited audience. In the language of advertising, however, it would be a *class publication* and not a *magazine*, the latter word being arbitrarily reserved for periodicals with a relatively wide appeal.

4. *Farm journals and mail-order publications.*—Farm journals and mail-order publications are intended particularly to reach people in rural communities. Farm journals are for the most part territorial in their influence and the circulation does not extend beyond certain agricultural belts. There are, for instance, corn-belt farm papers and wheat-belt farm papers. Other farm papers concentrate their circulation in certain states. For instance, there are three farm papers published in Minnesota. About sixty-five per cent of the circulation of the two leaders is in Minnesota with the remainder in North and South Dakota, Montana, western Wisconsin and northern Iowa. There are, however, at least six national farm papers, which advertisers use to reach farmers all over the country in the same way that they use the national

magazines to reach generally the inhabitants of cities and towns thruout the United States.

Mail-order magazines, so-called, are very much like national or territorial farm papers except that their subscription price is low and the material in them appeals usually to the woman on the farm more than to the man. The farm journal must be carefully distinguished from the mail-order magazine. The farm journals of this country have probably done as much as any other one influence to introduce better farming. They have gone hand in hand with the agricultural colleges and the United States Department of Agriculture in their great educational work. The mail-order magazines were introduced by a class of people who saw an opportunity for advertising in the rural districts where a large circulation could be obtained at a low cost. Both the mail-order magazine and the farm journal reach the same general class of people.

5. *Trade, technical and class publications.*—A periodical, to be classed as a trade, technical or class publication, must be edited so as to appeal to a certain group of people possessing common interests. A trade publication, technically speaking, is one that is devoted to the business interests of dealers in merchandise. *The Dry Goods Economist* is an example; it reaches owners and buyers of dry-goods stores and department stores. Many trade papers are exceedingly influential and are valued mediums for advertisers who wish to reach dealers. Almost every

line of business has its trade paper, and in some lines there are many competing publications.

A technical publication is ordinarily one that goes to consumers, instead of to dealers, and is devoted to the interests of those engaged in a technical activity. For example, *The Mining and Engineering Journal* is a technical periodical reaching mining engineers and others interested in the technical side of mining. Similarly, *The American Medical Journal* is a technical publication for physicians.

Class publications are periodicals appealing to a certain class of people, and not properly included among either trade or technical publications. Every religious denomination has its own class periodicals—about 1,200 in the United States. *Printers' Ink* is a class publication appealing to those interested in advertising, altho it might almost be classed as a technical periodical. Every large social group or association has its class paper. There are also class publications for the rural districts, such as *Kimballs*, *Dairy Farmer* and *Better Fruit*.

6. *Foreign language publications*.—Another large group of publications is found in the foreign language field. In a sense they are class publications, but they are so many and so important that they have a classification by themselves. There are nearly 1,300 publications in the United States printed in foreign languages. America is the great melting pot, and while the first occupation of the new American is usually that of learning the language, there are many

who speak English and cannot read it. These people can often be reached only thru the foreign language publications, which are for the most part published weekly, altho many appear daily and are usually newspapers in form and purpose.

7. *Directories*.—The next class of publications includes directories and miscellaneous periodicals. Directories include city directories, telephone directories, trade directories and all other periodical publications to which one refers when in search of names, numbers or other similar information. Advertisements in such publications are usually little more than display cards announcing the business of the advertisers. One of the most important of the directories is *The Automobile Blue Book*, which sells its space on the basis of a guaranteed circulation; a special book is issued annually for each section of the country.

Among the remaining publications that appear periodically, perhaps theater programs are most important for the advertiser. They are widely used for a certain type of advertising appeal to which a theater audience is supposed to be peculiarly responsive. The control of theater program advertising in the larger cities is now in the hands of a syndicate, so that it is possible for an advertiser to place a single contract for theater program space in a number of cities from coast to coast.

8. *Signs*.—The sign is probably the oldest form of advertising. The Egyptians and Romans were nations of sign users. Among the ruins of Hercu-

laneum and Pompeii there still exist signs carved in stone to advertise the wares of bakers and vintners and the services of hair-dressers. Modern signs are of six classes, with many subdivisions in each class. The six main groups are:

1. Dealers' signs
2. Posters
3. Painted bulletins
4. Electrical signs
5. Street-car cards
6. Theater signs

9. *Dealers' signs*.—Dealers' signs include all signs in or about the place where the article advertised is sold, distributed or manufactured. They include also the dealer's name over the door or in some other prominent place on the outside of the store. Usually such a sign is a simple announcement: "John Jones, Grocer." Some manufacturers have found it to their advantage to furnish permanent signs of this sort to dealers for the privilege of adding at the end "Buy Arbuckle's Coffee Here," or some other such phrase. Many advertisers supply similar signs for the window sills of stores. Then there are window trims, counter signs, wall signs and special display racks bearing the advertisement of the manufacturer who furnishes them.

10. *Posters*.—The poster is an out-of-doors advertisement printed on sheets of paper and pasted on flat display surfaces. Until a few years ago, posters

were pasted on fences or any other available flat surface with or without the permission of the owners. Today the poster plants of the country have established standard sizes of boards and rent all their locations. The standard poster sheet is twenty-eight by forty-two inches, and a single poster "stand" is made up of eight, twelve, sixteen or twenty-four sheets. The height of a poster is nine and one-fourth feet. The twenty-four-sheet poster is now becoming recognized as the standard size, giving a display twenty-one feet long by nine and one-fourth feet high. The different showings are graded by the class of boards on which they are displayed. The grades are AA, A, B, C, and D. The D board is a wooden structure without a frame. The AA board is a steel structure with a green molding frame and several inches of white paper or "blanking" around the sheets.

Poster advertising rates are based on the month of display, and the price of twenty cents a sheet a month is becoming standard thruout the United States except for preferred locations which are usually lighted.

11. *Painted bulletins*.—The next general group of signs include all kinds of painted bulletins. Painted bulletins are much like posters in purpose and in the kind of things that can be profitably advertised on them; but, of course, painted bulletins are much less widely used because each bulletin must be separately painted, and skilled artists are required to produce them. Painted bulletin advertising, for the most

part, is confined to the larger cities and to positions along the main traveled roads. Few of the smaller towns are equipped to furnish painted bulletins.

Painted bulletins may roughly be divided into three classes:

1. City boards
2. Railroad boards
3. Painted walls

The twenty-five-foot bulletin has for a long time been considered standard, altho of late many advertisers are using fifty-foot boards both in the city and in the country. Contracts are generally made on a year's basis. Contracts for railroad boards are often made for a longer period.

Painted walls average about 800 square feet in size and range in price up from \$40 a year, depending on the location. In cities, where the buildings are high and crowded together, few walls are available for painted display advertising, and those that are available are consequently high in price. Painted display advertisements showing to streets having a heavy night traffic may profitably be lighted at night by means of electric reflecting light. The price for signs includes the cost of painting, illuminating and maintenance. Lighted walls are usually sold on a flat rate per month based on the expense for rent, painting and illumination; this expense varies for different localities.

12. *Electric signs*.—"The Great White Way" de-

rives its name and fame from the electric advertising signs that illuminate it. In New York, upper Broadway at night is one of the sights of the metropolis. This is the electric sign center of the country. The number and effectiveness of the electric signs there and elsewhere prove that electric signs are one of the great advertising mediums.

Electric signs are ordinarily composed of sheet steel letters mounted on steel frames, each letter being lighted by a strip of incandescent electric bulbs by means of what are known as "flashers"—mechanical contrivances that automatically turn on and shut off the electric current. The copy and illustrations on these signs are frequently made to change at intervals, and possess great attractive value thru a combination of color, motion and pleasing design. Every important city in the United States has many of these electric signs.

The price is hard to estimate, as each stand is sold separately. Some locations on Broadway, New York, command as high as \$5,000 a month. Outside of New York attractive positions for signs may be secured for from \$300 to \$1,000 a month, and this price includes designs, cost of installation, maintenance and current. Signs are usually lighted from dusk until after midnight each evening. Some advertisers have set aside the greater part of their appropriations for this class of advertising mediums.

13. *Railway signs.*—Advertising in street cars, ele-

vated trains and subways has grown with the marvelous development of urban and interurban transportation. This class of advertising includes cards in the cars as well as bulletins on the station platforms. The "circulation" of this class of advertising mediums can be measured much more readily than that of any other kind of signs. The companies controlling street-car, elevated and subway advertising obtain from the transportation companies records of the fares collected, and the cost of space is based to an extent on these figures.

The standard street-car card is twenty-one by eleven inches, and one of the arguments in favor of the medium is the fact that each advertiser is given the same size of display. Contracts are made for one month, six months, a year, three or five years. In many localities the six months' contract is being eliminated, and effort is made to induce the advertiser to contract on the five-year basis, because it has been found that more five-year contracts are renewed than contracts for any other period.

Most of the space in street cars is now sold by one organization, the Street Railway Advertising Association. The prices in each community depend on the number of street cars in operation. An advertiser buys a "full run," which means a space in all the cars, or a "half run," which means that his cards appear in half of the cars. Ten years ago some advertisers used double space in "half runs" instead of single space in "full runs." Double space, however,

is no longer sold; all advertisers are given equal opportunity for display.

Street-car advertising differs from most other sign advertising in the fact that the public sees the display at a time when it has very little else to do except to read the advertisements. This medium takes advantage of the forced idleness of the street-car passenger at a time when his range of vision is confined to the interior of the car in which he is riding, and when there is little to distract his attention from the message of the advertisers.

14. *Theater signs*.—Since the introduction of moving pictures, another great advertising medium has been added. For a long time many theater proprietors have sold display space on their drop curtain, but the theater as a place to reach the masses with advertisements did not fully come into its own until the moving picture brought millions to the houses of amusement regularly. Many ingenious variations of theater advertising have been introduced. The most common is the stereopticon slide which national advertisers furnish to their retail dealers and which the retailers arrange to have displayed in local theaters.

Some national advertisers send out to a regular distributing agency moving pictures of their processes of manufacture and the uses of their goods. An expensive campaign of this kind was conducted by the Du Pont Powder Company, showing "Farming With Dynamite."

Moving picture films cost approximately a dollar

a foot for the first film and ten cents a foot for duplicates. Films of this nature vary from 250 feet to 1,000 feet in length. The showing of the film is usually arranged either with a film distributing agency or locally with individual picture houses by the advertiser's salesmen or by his dealers.

### REVIEW

What is the size of an eight-sheet poster? A twelve-sheet? A sixteen sheet? A twenty-four sheet?

What is the most effective dealer sign you have ever seen? Could something similar be used in your business?

On Broadway, New York, in the electric sign center of the country, there is an elaborate and expensive moving electrical display, advertising a certain brand of spool silk. Would you consider such a sign for such a product a good advertising investment? Why?

Some people object on esthetic grounds to posters and painted bulletins. In considering the use of these mediums, to what extent should the advertiser give weight to such objections?

For the business with which you are connected, could periodical advertising mediums be used advantageously? If so, which ones?

## CHAPTER X

### WEIGHING CIRCULATION

1. *The value of an advertising medium.*—There are two problems in selecting an advertising medium. First, what class of mediums should be used? Second, in the class or classes chosen, which particular mediums will aid the most in accomplishing the desired purpose? In this chapter we are to present certain considerations which will help in solving both of these problems. There are some questions to be asked about any class of mediums before one can properly choose it in an advertising campaign, and there are other questions to be asked and answered about individual mediums to determine their comparative ability to aid the advertiser. Ordinarily it is not enough to listen to the claims of those who present the merits of different mediums; there is much that the advertiser or his agent must do to supplement the available data about the different forms of direct mediums, periodicals and signs before he can be sure that he has selected just the right methods of carrying his advertising message to that part of the public that he wants to reach.

The value of any advertising medium is determined mainly by the answers to two questions:

1. What is the cost per possible purchaser reached by the medium?
2. What is the prestige of the medium in the minds of possible purchasers?

Only the first of these questions is considered in the present chapter. It should be noted that this question does not refer to the *cost per reader*. *Cost per reader* and *cost per possible purchaser* are two very different things. If an advertiser wished to know the cost per reader, all he would have to do would be to divide the advertising rate for the unit of space by the number of subscribers and other readers of the publication. A page rate of \$1,000, in other words, divided by a proved circulation of 100,000, would give a cost of one cent a page for each reader of the periodical. Unfortunately, however, each reader is not necessarily a possible purchaser of the advertiser's goods, nor does every reader of a medium necessarily see every advertisement in it; therefore it is necessary to consider other things than mere numerical circulation.

2. *Cost per possible purchaser*.—Every advertiser must decide how much he can afford to pay to reach every possible purchaser to whom a medium might appeal. This is a difficult matter, the decision varying with each individual case. The factors involved are well illustrated by the answer of an advertising man who was once asked, "If you had only one possible purchaser in the United States, how would

you undertake to advertise to him? Would it be advisable to use any advertising under such a circumstance?" He replied: "If I owned a mine valued at \$10,000,000 and wished to sell it to one steel magnate in the United States who could afford to buy it, and this man was not approachable in the beginning thru personal salesmanship, I might be willing to spend many thousand dollars in advertising that mine to that one man. My problem would be to study him and to use every advertising medium which would reach him. I should attempt to find his favorite publication, and I could afford to take full pages or even double pages in that publication. If I found that he had no antipathy for signs, I might arrange to have signs placed near his favorite drive, facing his office window, facing his favorite window in his favorite club and every other place where he might be expected to be. I should be willing to spend several thousand dollars on a booklet telling of my mine and of the opportunities it afforded. I should advertise to this man's friends, that they might talk about my mine. In a case of this kind I could afford to spend thousands of dollars per possible purchaser."

Fortunately, there is more than one possible purchaser for most advertised articles, but the things to be considered in the selection of mediums remain the same, regardless of the number of people whom the advertiser hopes to reach. The cost per possible purchaser is not a simple problem; it involves a variety of

considerations which have to be correlated and harmonized before the final answer is given.

The advertiser should begin his task of selecting mediums with the idea, already emphasized in a preceding chapter, that no particular class of mediums is better than any other particular class. It all depends on the purposes for which the mediums are to be used. Some are seemingly good for all kinds of advertising campaigns; others are more restricted in their appeal. Whether one medium or another is better for any particular purpose depends on the people the advertiser is trying to reach, the product that he wants to sell and the specific results that he hopes to accomplish with his advertising.

3. *Discovering the typical purchaser.*—The first thing to do in selecting mediums is to have a clear idea of the people to be reached. Who is the typical customer? Advertising is a mass appeal, and separate individuals cannot be appealed to separately. The group alone can be considered, and, before advertising to that group can be successfully undertaken, it is necessary for the advertiser to have a definite idea in his mind of the typical member of the group. Certain questions are to be asked in establishing the characteristics of the typical purchaser, and in the answers to those questions the advertiser often finds that certain mediums are naturally eliminated from the campaign, and that others naturally present themselves as worthy of consideration.

The statement that the advertiser should address

his message to the typical purchaser is subject to one qualification. Sometimes the actual purchaser of an article is not the one who really influences the purchase. The head of the household actually buys the piano, the automobile, and the talking machine; yet in very many cases he would never buy these things if he were not influenced to do so by some member of the family. The small boy of the family often has much to say about the kind of a car to be bought; accordingly some automobile manufacturers advertise in boys' magazines. The mother and her daughters usually decide what piano or talking machine is to be purchased; therefore these articles are extensively advertised in women's publications. A few makers of men's clothing, even, have advertised in magazines appealing chiefly to women, in the belief that women often influence their husbands in the matter of buying clothes. The typical purchaser, for the purposes of the advertiser, is the one who induces the purchase of a commodity, no matter whether he or someone else actually furnishes the money to buy it.

4. *Geographical conditions.*—First, is the market in which we wish to sell our goods, national, territorial or local? If it is restricted to a specific locality, we must choose local mediums only. Local mediums are chiefly newspapers and the various kinds of signs. Magazines, on the other hand, are the most commonly used national mediums. A national campaign, of course, may employ local mediums as well as those of general circulation.

In a local campaign an advertiser may wish to concentrate his sales and advertising activity in one part of a community. He is helped to do this by some newspapers that divide their statements of circulation so that the advertiser can tell how much of it goes to the city proper, how much to the suburbs and how much to the surrounding country. A few of the larger newspapers even go so far as to indicate on maps the number of copies that go to the various sections of the city. Similarly, in the case of magazines, many publishers now provide statements of circulation by states, to enable the advertiser to choose the medium that goes most intensively into the territory he wants particularly to cultivate. Detailed circulation statements of this sort are required of those publications that are members of the Audit Bureau of Circulations.

In the geographical study of the advertiser's problem the second question is this: Is the typical purchaser to be found in cities, in small towns, or in rural districts? If the purchaser is to be found in the city, the advertiser may use city newspapers, signs, posters, bulletins or street-car cards when the market is local. If it is national, he may use these mediums together with certain magazines. On the other hand, if his typical possible purchaser is in the small towns, he may use what are known as "small-town magazines," and possibly the country weeklies as well. In the country he must rely chiefly on the agricultural and so-called mail-order publications.

Of course, geographical considerations have nothing to do with the use of direct mediums. They may be used to reach possible purchasers anywhere.

5. *Social conditions.*—As we study our typical purchaser, we see how carefully the different advertising mediums have planned to reach different groups. The first question in determining the social standing of possible purchasers is: Will the purchase usually be made by men, by women or by children? The second question is: Are the goods intended for the rich, the middle class of people or the poor? There are few commodities that are purchased only by men, or only by women, or only by children. There are few, also, that are purchased only by the rich, the middle class or the poor. The advertiser's problem is to find to which of these classes he is to make most of his sales, and then pick the mediums that seem to circulate most effectively among those classes. If sales are to be made in any quantity to several classes, he must consider each class as a problem by itself, and pick different kinds of mediums which will reach the greatest number of possible customers with the least waste circulation.

In fixing the social position of the typical purchaser, the advertiser asks a third question: Is the purchase made by family groups or by individuals? Vacuum cleaners are seldom sold to bachelors in boarding houses. Even tho it might be advisable for educational purposes to advertise certain articles of household use to unmarried people, an advertising

medium going only to unmarried people (if there were such a medium) would be of little value in a campaign to sell articles of this sort.

Still another question is this: Is the purchase made by young, middle-aged or old people? A manufacturer considered a certain magazine an ideal medium for him until it was found that the magazine circulated chiefly among the middle-aged, while his product could be sold only to young people. A fashionable tailor, who has the greatest portion of the wealthy trade in a western city, says: "While the majority of my customers are men of middle age, have you noticed that I advertise only to young men? When a young man begins to consider tailor-made clothing he has passed the age of to-be-a-man-I-must-look-like-papa. He begins to think the old man is a little seedy. Just at that age, also, a father is very proud of his son. I have found that you cannot expect a young man's trade just because you hold his father's trade, but that you can often get the father's trade thru the son."

The advertiser is fortunate who is able to divide and subdivide the people in his market until he has an exact picture of the typical group to whom he wishes to talk. Perhaps he is selling only to professional men, or only to clerks, or only to skilled mechanics. Perhaps his product appeals only to mothers, perhaps only to society women. A woman may be both a mother and a society woman. The advertiser must decide to which side of a woman's na-

ture he is to appeal, and pick his mediums accordingly. If he is advertising to men, he must use mediums that appeal to those interests of men to which his own product appeals. A magazine dealing with out-door sports, even tho circulated only among men, would scarcely be a desirable medium for office furniture. The ideal medium would be one devoted to men's business interests.

For nearly every group of people there are one or more available mediums, and before the advertiser can determine the value of any medium to him he must discover the particular social group to which it makes its appeal.

6. *Circulation statements.*—We have been considering questions to be asked and answered by the advertiser in selecting, first, the kind of mediums to be used, and, second, the particular mediums to be chosen in any class. The remainder of this chapter is concerned chiefly with factors in the comparison of individual mediums rather than in the selection of broad groups of mediums for the advertiser's campaign. Geographical and social considerations, in other words, help the advertiser to decide whether or not to use magazines, and, if he is to use magazines, whether to use publications that appeal chiefly to men, women, children; the rich, the poor; the young, the old, etc. If he is to use women's magazines, for instance, these considerations also help him somewhat in choosing from the many women's publications covering the field he wants to reach. There are other

things to be considered, however, in selecting individual mediums in any group. The things to be studied fall chiefly under two heads: circulation (including rates) and prestige.

The problem of finding the exact circulation of a medium is by no means so easy as it may seem. This fact is partly, altho by no means entirely, the reason for the rather slow development of demand on the part of advertisers for exact statements of circulation and of willingness on the part of publishers to comply with these demands. The progress of advertising may be traced by the different stages in the development of accurate and complete statements of circulation.

The circulation of an advertising medium is constantly changing. Even in the case of direct mediums, which are entirely under the control of the advertiser, there is always the "death" rate to be considered. People are constantly moving from place to place, and the list of names must be kept up to date. It is estimated that in ordinary business lines twenty per cent of any mailing list "dies" every year; in other words, twenty per cent of the names or addresses must be eliminated or changed.

Newspapers are largely sold by newsboys on the street, and much of this circulation may be transient. Ninety-eight per cent of the circulation of some magazines is news-stand circulation, and a news-stand circulation may or may not mean either the same readers or the same number of readers from month to month.

Even when magazines go chiefly to subscribers, new subscribers are constantly being added to the lists and old subscribers taken off. It was natural, therefore, for publishers to be slow in approaching such a difficult task as the preparation of circulation statements of sufficient accuracy and completeness to make them of any value to the advertiser.

Nevertheless, an advertising rate is necessarily based on the amount of circulation, and advertisers are becoming more and more insistent as to the quantity and quality of the circulation they buy. Circulation statements have in the past been indefinite, and often justly open to suspicion.

*7. History of circulation statements.*—In 1868, Mr. George P. Rowell introduced a plan of insuring reliability of circulation statements. Publishers were asked to furnish to him statements of circulation, depositing a forfeit of \$100 each. The amount deposited by each publisher was offered as a prize to any person finding his circulation statement to be false.

Another of the early plans looking toward accurate statements of circulation was conceived by a western advertiser, Colonel Emery Mapes of the Cream of Wheat Company. He asked each publication to guarantee a certain amount of circulation on which its rate was based, with the understanding that his own auditors should be allowed to audit the circulation, and that, if it was found not equal to the amount guaranteed, he should be rebated pro rata. This plan was

so successful that several magazines later guaranteed their circulation to all advertisers offering a pro rata refund in case the circulation of any issue did not equal the guaranteed circulation on which the advertising rate was based.

Prior to the organization of the Audit Bureau of Circulations there were a number of private auditing associations, many of them performing a useful service. The idea was conceived of bringing all these associations together in one organization composed of publishers, advertising agents and advertisers, the membership dues to be spent in thoro audits of circulation for the common benefit of the members. In this way the Audit Bureau of Circulations was born. It has already proved its usefulness, and there is a possibility that at last the difficult problem of obtaining accurate circulation statements is in a fair way to being solved.

In 1912, the United States government began to require circulation statements from all newspapers that applied for second-class mailing privileges.

8. *Duplication of circulation.*—Most people read more than one magazine or newspaper. Accordingly, the advertiser in selecting his mediums sometimes finds it advisable to determine to what extent the circulation of the periodicals he is considering is “duplicated”—in other words, the number of readers of one medium who are also reached by other mediums. Some advertisers have contended that duplicated circulation is largely waste circulation—that if

magazine A and magazine B each has a circulation of 10,000, and if fifty per cent of the readers of magazine A are also readers of magazine B, the latter medium is not of so much value to an advertiser as magazine C would be, also with 10,000 circulation but reaching a group of readers few of whom are subscribers to magazine A. In this case magazines A and B would be said to have a fifty per cent duplicated circulation.

Duplicated circulation is not necessarily a bad thing; it may be a very good thing, if the advertiser can afford to pay for it. An advertiser conducting an intensive local campaign will use newspapers, street cars, posters and other mediums, with full knowledge that the people who read his advertisements in the newspapers will also be likely to see the street-car cards and his other sign mediums. He is anxious that they should; he realizes that the average purchaser needs to be influenced many times in many ways before he will buy. In like manner, the intensive advertiser will use several periodical mediums, many of which are read by the same people, in the well-founded belief that an advertising appeal that comes several times to the attention of a reader will be more effective than if it came before him only once. The intensive advertiser further realizes that an advertisement in a single medium may not even be seen by many readers of that medium, while, if it appears in several mediums, the reader who subscribes

for all of them will be likely to see the advertisement at least once.

Every advertiser, however, cannot be an intensive advertiser. A man with a limited appropriation may find it more advisable to reach 20,000 people by using two magazines, each with a 10,000 circulation, than to reach only 15,000 by using two other magazines, each with a circulation of 10,000, but with a fifty per cent duplication. To advertisers of this sort, and also to advertisers who wish to cultivate their field intensively but who properly wish to control the degree of intensity of their advertising efforts, the problem of duplication in circulation is an important one.

9. *Extent of duplication.*—There is much duplicated circulation among all mediums. Scarcely any two mediums can be found, no matter how widely different they may be in kind and appeal, that do not show some duplication of circulation. It is estimated that there are not over 10,000,000 people in the United States who read the class of mediums technically known as magazines, and yet the total circulation of all magazines reported by the *American Newspaper Annual* for 1915 was 49,464,000. The number of people reading magazines is increasing fast, certainly much more rapidly than the population of the country. In 1905 the total circulation of magazines was 15,122,000, while in 1910 it was 25,512,000. The duplication of circulation is probably increasing at fully as fast a rate.

The most extensive investigation of the duplication of circulation yet conducted was made under the auspices of the Association of National Advertisers in the summer of 1914. It was found that the circulation of some magazines duplicate the circulation of others to the extent of almost fifty per cent. For instance, the *Ladies' Home Journal* was found to duplicate with the *Saturday Evening Post* to the extent of forty-two per cent. The percentage of duplication in most cases, however, was very much lower than this.

A similar inquiry in regard to newspapers was made by Professor Walter Dill Scott among 4,000 business and professional men in Chicago. The replies showed that:

- 14 per cent read but one newspaper
- 46 per cent read two newspapers
- 21 per cent read three newspapers
- 17 per cent read four or more newspapers
- 84 per cent read more than one newspaper.

The same advertisement seen in two or three newspapers is certainly more effective than if seen in one, but some advertisers are convinced that it is not worth three times as much to have an advertisement seen in three papers, reaching largely the same readers, as it is to have it seen in one.

10. *Subscription price as barometer of purchasing power.*—Some people contend that the buying power of a consumer can be determined partly by the

amount he pays for a periodical. It is maintained, for instance, that the buying power of readers of magazines, as a class, is greater than the buying power of the average reader of a newspaper. This is probably true; there may be some people who hesitate to pay fifteen cents, or ten cents for a magazine, and yet they can and do pay a penny for a newspaper. It is probably true, also, that the readers of a three-cent newspaper have a greater individual purchasing power than the average reader of a one-cent newspaper. It is not safe to apply this principle too generally, however. Certain magazines sell for twenty-five and thirty-five cents a copy; possibly their readers represent greater average purchasing power than the readers of a ten-cent fiction magazine; this is by no means certain, however, because ministers, teachers and others with relatively small incomes are found in large numbers on the subscription lists of the more expensive periodicals, while popular priced fiction circulates as extensively among families of wealth as among the less well-to-do classes.

A better guide to buying power of readers than the cost of the periodical is a careful study of the contents of the magazine or newspaper. This will usually enable the experienced advertiser to form a sufficiently accurate picture of the type of reader to which it appears. Some publishers now prepare for advertisers carefully compiled statistics showing how many of their subscribers own automobiles, how many play golf, how many do this and how many do that.

Such statistics are helpful in suggesting purchasing power of subscribers.

11. *Page rates per thousand*.—Each publication fixes its own advertising rates on the basis of cost and demand. Some have attempted to establish a standard basis for so-called “standard” magazines, of a dollar per page per thousand circulation. A “standard” magazine is one with a type page five and one-half by eight inches in size. Most magazines were formerly of this size, altho the trend is now decidedly toward a larger page. Even among the “standard” magazines there has never been uniform adherence to the standard rate. *Everybody's*, for instance, has sold space practically on the standard basis (ninety-two cents per page per thousand), while the *Atlantic Monthly* has sold space for three dollars per page per thousand, and the *Popular Magazine* for seventy-five cents.

Newspaper rates are even more variable than magazine rates. Many newspapers with only a thousand circulation charge fifteen cents and more for a column inch, while some large metropolitan newspapers with circulation in excess of 100,000 charge as low as \$1.40 a column inch.

12. *The flat rate*.—Practically all magazine space is sold at the same price regardless of the amount of space used. This is known as a “flat rate.” Many of the smaller newspapers also sell on flat rate; the larger newspapers, however, still have in many cases what are called “sliding scale rates.” A sliding scale

rate is based on the number of lines of space used by an advertiser during a year. The advertiser who uses only a thousand lines pays, perhaps, fifty per cent more per line than the advertiser who uses 20,000 lines. Nevertheless, the tendency among large as well as small papers is to adjust their schedules on the flat rate basis; most advertisers prefer this arrangement, and the advertising agencies are demanding it.

Nearly all agricultural publications sell space on the flat rate basis. Trade, technical and class publications are still inclined to the sliding scale rate, and in this field the rates vary more than in any other.

Some newspapers have two rates, charging one to national advertisers (known in the newspaper field as "foreign advertisers") and another to local or retail advertisers. In some cases the national rate is lower than the local rate, and in other cases it is higher.

13. *Contracts for space.*—The New York Association of Advertising Agents has established a uniform style of contract for purchasing newspaper space, which suggests the difficulties under which the advertising business has labored in the past and the policies which the agents' association believes will result in remedying them.

#### CONDITIONS OF STANDARD CONTRACT

1. It is understood and agreed that the rate of this order is the minimum rate at which a contract for similar space and

conditions can be secured, and that if at any time during the life of this contract you make a lower rate for the same space and conditions, then this contract is to be completed at such lower rate from that date.

2. We reserve the privilege of using space for this advertiser for one year from date at rates named on rate card on which this order is based.

3. Unless otherwise agreed, this order may be canceled or less space used by the payment of short rate in accordance with rate card on which the rates of this order are based.

4. Short rate bills must be rendered within thirty days after expiration of contract.

5. Any insertion not in accordance with instructions will not be paid for.

6. The advertising must appear in the editions issued on the date for which the advertising is ordered, when received in time for early editions.

7. A copy of each issue in which the advertising appears must be sent to the advertiser and to the office of this agency.

14. *Preferred position.*—It seems to be established that certain parts of a periodical publication are more desirable advertising mediums than others. The outside back cover, for instance, is considered a particularly desirable position—so desirable, indeed, that the back cover of the *Ladies' Home Journal* sells for \$10,000 an issue, while the regular page rate is only \$6,000. The inside cover pages sell for \$8,000 each. There is preferred position in newspapers as well as in magazines—top of column, for instance, next to reading matter. The constant cry for “position” is the bane of the newspaper publishers’ existence. Most of them protect themselves by adding a charge, running up to twenty-five per cent of the regu-

lar space rates, when an advertiser specifies the particular position he wants his advertisement to occupy.

The desire to have advertisements appear next to reading matter is largely responsible for the present tendency to increase the size of the magazine page. Most publishers who have enlarged their pages, still keep the advertisements in the front and the back of their publications, but they have few pages carrying advertisements exclusively; usually there is a column of reading matter and two columns of advertisements on one of two facing pages.

15. *When to use preferred position.*—In choosing an advertising medium the advertiser must consider the competition with other advertisements which his advertisements will meet. To get the maximum amount of attention, he must dominate. If all other posters near his are sixteen-sheet posters, he may get more attention by introducing an eight-sheet poster, but he will probably get most attention by using a twenty-four-sheet poster. If a sufficiently increased number of people will see an advertisement because it occupies unusually large space or because it occupies preferred position, the large space and the preferred position are worth the increased investment, to the extent that the advertiser can afford to pay for an increased number of readers, and to the extent that the proportionate increase in cost of space actually measures the increased attention value of the advertisement. Some attempt has been made by psychologists to establish general principles to

guide the advertiser in the solution of this difficult problem, but the tests so far conducted are not conclusive enough for the average advertiser. Each advertiser must make his own experiments, finally standardizing on the space and position that his own experience, added to the experience of others, proves to be best adapted to serve his particular purposes.

### REVIEW

Draw a mental picture of the purchaser of a \$3,000 automobile. What mediums would you use to reach him?

What advertising mediums most influence you in your buying? Why?

Why do agencies prefer the flat rate basis for newspaper rates?

Have you a definite concept of the typical customer of your business?

## CHAPTER XI

### WEIGHING PRESTIGE

1. *The meaning of prestige.*—In weighing the value of an advertising medium, the advertiser first considers its circulation—the unit cost of reaching each possible purchaser. The careful study of this problem involves all the things discussed in the last chapter. After weighing circulation, the advertiser next asks himself this question: What is the prestige of the medium? Prestige means influence. The prestige of an advertising medium is the influence it has on its readers. Its prestige is measured by the confidence of its advertisers. Prestige is important to the advertiser because the degree to which readers will be influenced by advertisements appearing in a medium is largely determined by their confidence in it. No two mediums have exactly the same prestige; the advertiser's problem is to pick out those mediums that will have the most influence on the particular class of people that he wishes to reach.

2. *Prestige of direct mediums.*—The prestige of direct mediums varies in three ways. First, it varies with the kind of the medium. A sealed letter sent out under a two-cent stamp, for instance, ordinarily carries more prestige than an unsealed letter under

one-cent postage. Second, the prestige of a direct medium varies with the quality of the medium. An attractive, clean-cut letterhead has more prestige than a slovenly, poorly arranged one. A good advertising specialty—a paper-knife, for instance, strong, durable, attractive—has more prestige than one that is badly constructed and obviously cheap. Third, every direct medium shares the prestige of the advertiser who uses it. A form letter from a well-known, highly respected business establishment has more prestige than an equally good letter from a house of which the recipient has never heard.

3. *Prestige of signs*.—Many forms of signs at one time had little prestige. When posters were pasted chiefly on fences, dead walls and everything else except when kept off by a "Post No Bills" notice, many advertisers and many members of the public did not take posters very seriously. Now, however, the bill-posting business has been made a real business. Bill-boards are standardized mediums; they are placed where a known amount of traffic regularly passes; and the space they occupy is leased and paid for. Posters, too, have improved in character; the advertiser strives now for artistic attractiveness. Posters' art is gradually developing as a branch of art, as well as a branch of advertising. There is still some esthetic objection to all posters, but this attitude of a small minority is certainly not lessening the influence of billboards. Poster advertising has proved its value to many advertisers. Signs of all

kinds are steadily gaining in prestige and in value as advertising mediums.

4. *How prestige works.*—Mr. John Lee Mahin, in his book “Advertising—Selling the Consumer,” gives an interesting illustration of the way in which prestige makes itself felt. He asks you to assume that you are on the mailing list of a bond house, and that you are also a regular reader of a morning paper, a monthly magazine and an illustrated weekly. One morning you receive from the bond house a circular describing a new issue of attractive investment bonds. It happens, that same day, that you see advertisements of those same bonds in your newspaper, your favorite magazine and your illustrated weekly. Assume that in all cases the advertisements are well prepared, and each one, regardless of the medium in which it appears, goes far toward influencing you favorably with respect to the bond issue. Which medium would have the greatest influence with you?

If your purchases from the bond house that sends you the circular have been profitable, the direct advertising of the circular would probably have the most prestige. If your experiences with that house, however, have been unpleasant—if you have been indifferently served, or if you have been dissatisfied with your purchases for any reason—the circular will have little influence. The circular would carry little prestige, also, if you had never heard of the house issuing it. In both these latter cases, an advertisement carrying the prestige of your favorite newspaper

or magazine would probably be more influential than the circular.

If a bond house were to advertise in periodical mediums, and were also to send you a circular, the circular might influence you favorably, even if you had never heard of the advertiser before, because the advertisements in your favorite magazine and newspaper would give to the circular a prestige that it could not have if it stood alone.

5. *Factors in prestige.*—The prestige of direct mediums and of signs cannot be measured by the application of any formula. Each advertiser must measure it by a study of local sentiment, by a study of his own past experiences and the experiences of others, and by a wise exercise of his own judgment. There is no formula, either, for weighing the prestige of periodicals; individual judgment here, as in the case of the two other kinds of mediums, must be largely relied on. Yet, in the case of periodicals there are certain tangible factors to be used in the weighing process which are usually absent in measuring the prestige of direct mediums and signs.

Prestige is the result of character. A man's reputation is the world's estimate of his character, and reputation is based on habits. The same thing is true of a periodical. The advertiser can judge its prestige by considering its habits. These "habits" are usually termed policies, and they have to do with three different phases of the management of a publication:

1. The policies of the editorial department
2. The policies of the circulation department
3. The policies of the advertising department.

6. *Editorial policy.*—The policies of the editorial department of any medium have much to do with measuring the degree to which advertisements appearing in that medium will influence its readers. Editorial policy largely determines the reader's attitude toward everything in the periodical. Someone has said: "The mission of an advertisement is threefold—to be seen, to be remembered and to be believed, and the greatest of these is to be believed." Unless a reader believes what he sees in the news columns he can scarcely be expected to have much faith in the advertisements. Accuracy of statement, a record for conservative under-statement rather than habitual publication of mere rumors, and a proved desire to play fair with the public, build for a publication a body of readers who believe in it and in what it says. Such a publication has prestige of the first rank. The confidence bred by an editorial policy founded on a real affection for the truth is not confined to the news and editorial departments; it works for every advertiser who uses such a medium. The reader who believes in his favorite magazine or newspaper is very likely to believe in the advertisements that appear in it.

Editorial policy also helps the advertiser to determine what kind of people read a publication, as

well as the length of time that the average reader may be expected to give to its perusal.

7. *Circulation policy*.—The Audit Bureau of Circulations asks some pertinent questions in regard to how circulation is obtained, in an effort to find out what prestige the publication has in the minds of its readers. The first general question is: Have the readers all purchased the publication? Publications are asked to report the number of free copies circulated as well as the number of paid copies. They are asked to report the number of copies sold in bulk as well as those sold to individual subscribers. Publishers are asked how long subscribers are carried in arrears, and what proportion of their subscribers are in arrears.

In the case of a subscription publication the percentage of annual renewals is a guide to the number of people who consider the publication necessary. Voluntary renewals of subscriptions are valuable indications of prestige.

Newspapers are also asked to divide their circulation by editions, stating the hour each edition is published. Some advertisers believe that the time of day when a reader receives a publication is a measure of the degree of thoroughness with which it is read. If a medium is only hastily perused, the reader's attention is not likely to be held very long by the advertisements appearing in it.

8. *Morning and evening papers*.—Morning and evening papers are frequently in competition, and

their publishers set up competing claims of superiority for their publications as advertising mediums. Some morning papers see no good in evening papers, and some evening papers see no good in morning papers. Each kind of publication has its partisans among advertisers. The controversy leads into a discussion of the habits of people in different localities—what proportion of the morning papers are read by men on their way to work and are little seen by women in the home, what proportion of the population spends its evenings at places of amusement instead of quietly at home in the company of the evening newspaper, and a variety of similar considerations. The fact seems to be that neither morning nor evening papers, as a class, can claim superiority. Both have been proved to be good advertising mediums. In some communities, it is true, an evening paper is the recognized leader, while in others a morning paper leads as the better medium; but, where this is the case, the superiority seldom results from the fact that the leader is an evening or a morning paper—usually it is due to other elements of prestige entirely independent of the time when the paper is issued.

9. *Sales and subscription magazines.*—A sales magazine is one sold chiefly at news-stands or by newsboys. A subscription magazine is one sent chiefly to regular subscribers. Each, as an advertising medium, has its advocates. Those in favor of news-stand circulation say that when a reader takes

the trouble to buy any particular issue of a magazine at a news-stand, it argues a real value which he attaches to that issue, and he is likely to read it carefully; while certain issues of a subscription magazine, coming periodically thruout the year, may be left unread or only hastily perused. The advocates of subscription magazines maintain that subscription circulation usually means home circulation; furthermore, a subscription to a magazine implies prestige—it means a definite desire for the publication on the part of the subscriber.

The truth probably lies in the fact that no periodical is a good or a bad advertising medium just because it has a news-stand circulation or because it has a regular circulation among subscribers. Here, as in the controversy between evening and morning papers, value as an advertising medium is chiefly determined by elements of prestige in the minds of readers, entirely independent of the ways in which, or the time at which, the publication is purchased. If a magazine is sold largely at news-stands, the advertiser wants to know where the stands are situated and the class of people who patronize them. The people who buy a publication are more important than the way in which they buy it.

10. *Advertising policy*.—Editorial policy is important to the advertiser because it serves as a general guide to the kind of people who read a periodical and to the amount of influence the medium is likely to have with its readers. Circulation policy is impor-

tant because it indicates the actual value placed on a medium by those who read it. Both editorial policy and circulation policy, therefore, are important aids in the advertiser's task of weighing prestige. But more important, perhaps, than either of these is the policy of the advertising department. An advertisement, like a man, is known by the company it keeps. An advertising policy that directs the acceptance of any advertisement offered to a periodical, is likely to put an advertiser in bad company. The prestige of a publication largely depends on the desire and ability of the publisher to publish only such advertisements as are honest and do not offend the taste or morals of its readers. A publication is not a public institution. It may accept or reject such advertisements as it pleases. The publication that makes no rejections is likely to have little prestige.

The movement toward the censoring of advertisements has two phases. One is the tendency, dictated either by policy or conviction, to exclude advertisements—liquor and tobacco advertisements, for example—that might offend some portion of the readers of a publication. The other is the tendency to protect readers against loss by excluding dishonest advertisements. Probably the first step in the campaign against dishonesty in advertising was to exclude those patent medicine advertisements that made exaggerated claims. In order to be sure that they are on the safe side, many periodicals now exclude all advertise-

ments of patent medicines, regardless of their wording.

The second step in the campaign for honest advertising was the careful study of all advertisements submitted to a publication, to the end that the publisher might be certain his readers would not be defrauded or even misled by anything appearing in his advertising columns. This important movement has made tremendous strides. Only a few years ago almost any advertisement would be accepted by almost any publication. Today there are very few publications that do not exclude entirely certain classes of what they believe to be objectionable advertising, and which do not make some attempt to convince themselves of the honest purpose of every applicant for space. The extent to which this is done varies in different publications. Many publishers actually guarantee the truth of every word in every advertisement appearing in their columns.

11. *Typical advertising policies.*—Farm journals in many cases have taken an advanced stand for honest advertising. A typical story is told of one farm paper that accepted in good faith the advertisement of a manufacturer of a new type of farm machinery. The manufacturer was entirely honest in his purpose; he believed his machine was meritorious and that he could make good all claims in his advertisements. The publisher investigated the business carefully, was convinced that it was sound and honest in every way, and accepted a one-time advertisement for which he

was paid less than \$300. Three of his readers bought the advertised machine at \$750 each. Deliveries were not made when promised, and, when the machines did arrive, they did not come up to the claims of the advertisement. The publisher, when complaints reached him, immediately sent his check reimbursing each subscriber in full. Such high-minded concern for the welfare of readers builds the strongest kind of prestige. One does not wonder that advertisers eagerly seek space in publications that take this advanced stand to protect their readers.

No particular class of publications is alone in the movement for honest advertising. The better newspapers are gradually eliminating objectionable and dishonest advertising, and a few, led by the *New York Tribune*, guarantee their readers against financial loss resulting from advertisements appearing in their columns. Many magazines have adopted the same policy. For example, *Good Housekeeping* has long guaranteed the statements of its advertisers. But it has not stopped here. When Dr. Harvey W. Wiley resigned as chief of the Bureau of Chemistry at Washington, *Good Housekeeping* retained him to analyze all food products advertised in its pages and to establish a definite standard for acceptance of food advertisements. That such a policy pays is indicated by the fact that, while thousands of dollars' worth of advertising were rejected during the first year, the increase in the magazine's advertising since that time has been remarkable.

As illustrative of the policy adopted by many magazines we quote the following statement of censorship exercised by the Curtis Publishing Company with reference to advertisements which will be accepted for the *Saturday Evening Post* and the *Ladies' Home Journal*:

The *Saturday Evening Post* and the *Ladies' Home Journal* accept no advertisements:

1. Of medical or curative agents of any kind
2. Of alcoholic beverages
3. Of subjects immorally suggestive
4. Of a nature unduly cheap or vulgar, or that is too unpleasant either in subject or treatment
5. Of a "blind" character—that is to say, advertising which in purpose and intent is obscure or misleading
6. Of "free" articles unless the article is actually free (a thing is not free if the reader is obliged to perform some service or buy some other article in order to obtain it)
7. Of a financial nature, if highly speculative
8. "Knocking" competitors.

Mr. S. K. Evans has the following to say for the *Woman's Home Companion*:

I want our readers to feel that the *Woman's Home Companion* will go shopping with them thru the advertising pages, and will guarantee to make good every advertiser's representations. No reader can have much purchasing security by any other method of shopping, and I want to keep that faith inviolate.

We have had several interesting cases in which we were given an opportunity to prove our principles. A woman bought a bird from one of our advertisers some time ago, and when it arrived it was a dead bird. She wrote to the concern,

but it made no effort to satisfy her. Then she wrote to us. It was a small matter to have reimbursed the woman, but we were after the principle, and kept after the advertiser until he finally made good to the woman. She had done her part, doing exactly what the advertiser asked her to do, and had sent her money. If she had been given no satisfaction, her entire faith in advertising might have been shattered.

The associates of one's advertisements are just as important indications of character as the associates of an individual. We repeat: The objects of an advertisement are three: to be seen, to be remembered and to be believed, and the greatest of these is to be believed. One should prepare his advertisements and choose his mediums with this thought uppermost in mind.

## REVIEW

What are the factors in the prestige of an advertising medium?

Have you more confidence in the advertisements in some periodicals than in others? Why?

What class of mediums and what individual mediums would give most prestige (regardless of circulation) to advertisements of the product or service of the business in which you are engaged?

Is it good policy for a publisher to guarantee the truth of advertisements? If so, why do not all publishers do it?

## CHAPTER XII

### LETTERS AND DIRECT ADVERTISING

1. *Components of direct advertising.*—All direct advertising thru the mail centers about the letter. In a broad sense any letter written to a customer or prospect for the purpose of obtaining business partakes of the nature of advertising. But this term is not often applied to general correspondence where each letter is personal; it is used to signify form letters reproduced by mechanical processes and sent to lists of persons together with the accompanying inclosures. It stands mid-way between the sales letter and general publicity. One is written for a particular person and sent to him directly, the other is addressed to all the persons of a group whom it reaches indirectly. Mail advertising while general in its appeal to all the persons in a group is sent to them directly as individuals.

2. *Advantages of mail campaigns.*—Direct advertising thru the mail, as compared with the more indirect methods of advertising, has several strong points in its favor. Among these may be mentioned the advertiser's ability (1) to limit the expense of his campaign; (2) to guard trade information; (3) to concentrate his advertising upon a particular community or a particular class of people; (4) to time the reading of the advertisement; and (5) to make

inclosures of samples or return envelopes that encourage the prospect to order on the spot.

Mail advertising permits the expenditure of small or large sums of money as conditions may dictate. The sum spent for sending out a series of letters is determined mostly by the length of the manager's mailing list. In magazine advertising, on the other hand, the cost comes in large units. To an inadequately financed business, this consideration is especially important; tho even a successful and amply financed business must select its advertising mediums according to the limits set by its advertising appropriation.

The advertiser may choose mail advertising as the best means of controlling trade information. Special price appeals may be made thru this medium with less danger of incurring the ire of competitors. Patents, new types of machines, new patterns in fabrics—the particulars of these must, of course, be disclosed in order to sell the product; yet the advertiser may wish to confide his plans only to a limited number of prospective buyers. The advantages of a "gum-shoe" campaign are well appreciated by practical advertisers.

An advertisement in a dental magazine might seem sure to reach a definite and homogeneous class of people. Nevertheless, a mailing list of the dentists graduated from the University of Illinois would enable the advertiser to reach a group within a group. An advertising letter to such an inner group may be

composed so as to make an especially strong appeal. In the same way a thoro test may be made of a particular locality by directing mail matter to all the known prospects, and adapting what is sent to special local needs.

Mail advertising permits the advertiser to time the reading of the advertisement more exactly. If the prospect is a dealer, he will probably open the letter at his desk. If the letter contains a stamped and addressed inclosure, the conditions are good for getting an immediate response. An advertisement in the dealer's trade magazine, on the other hand, may fall under his eye on the car home, or at some other time when active response is impossible. Again printed advertisements only receive a limited degree of attention, so that a full description of a product in a "printed advertisement" would be impracticable; the more so since the description would probably be in fine print.

3. *The uses of direct advertising.*—Direct advertising may be used to get orders directly or it may be employed for other purposes. It may be used to supplement the work of traveling salesmen. It is often used to precede the introduction of a new specialty or a new policy, which assures the salesman when he calls that the prospect is at least partially informed in regard to the organization and product which he represents. The form letter is used also to introduce a new salesman, and thus often prepares a welcome for him when he calls.

It is becoming more and more difficult for a salesman to work advantageously without active support from the house which he represents. Direct advertising provides a means by which the salesman's statements are authoritatively supported over the signature of one of the officials of his company.

A certain sales manager estimates that his firm loses \$8,500 a year thru calls by his salesmen upon buyers who are absent from their offices at the time of the call. He could save that loss if he could devise an appointment system that would insure that the buyer would be on hand when the salesman calls. Direct advertising may help in such a case. Even tho it fails to insure an appointment in every instance, it may indicate whether or not it is worth while for the salesman to go to great trouble to make an appointment with a particular prospect.

The visit of a salesman is a large expense, and there are many dealers to see and few salesmen to see them. By using letters at frequent intervals, to supplement the calls of salesmen, the manufacturer or jobber is enabled to keep closely in touch with his distributors and at the same time cut down expense.

4. *Compiling the mailing list.*—The success of a mail campaign depends primarily upon the mailing list. Bad advertising matter sent to a live list is no doubt partly wasted, but good advertising sent to a bad list is yet more futile.

The first step in compiling a mailing list is to determine what class of people are most likely to buy the

goods offered. Certain broad classifications may be quickly determined; for example, those based on sex, on occupation, on income, or on foreign extraction. Business and professional men are said to be liberal buyers of certain commodities; while bankers and farmers are conservative buyers.

The selection of the sources of mailing list names is seldom difficult. The following outline is suggestive of the many mines of information for the wide-awake advertiser.

## I. Directories

### a. Local

1. City
2. Telephone
3. Social registers, "blue books," etc.

### b. Sectional and national

1. Rating books
2. Trade directories

## II. Government records

### a. Local

1. City and county tax lists
2. Building permits
3. License and marriage records
4. Registration lists

### b. State

1. Secretary of State's records (automobile licenses, for example)
2. Labor reports

### c. National

1. Income tax lists
2. Consular reports
3. Departmental publications (notably, reports of the Bureau of Foreign and Domestic Commerce)

## III. Organizations

- a. Business (Commercial clubs)
- b. General.
  - 1. Fraternal
  - 2. Social
  - 3. Labor

## IV. Press clippings (press clippings may be collected about any subject affecting the advertiser's interests; e.g., names of advertisers, society notes, fires, births, marriages, deaths, transfers of real estate, etc.)

## V. Advertising (study of advertisements in all kinds of periodicals yields valuable names for a mailing list)

## VI. Miscellaneous

- a. Employes of business houses
- b. Lists exchanged with other advertisers
- c. Listing companies
- d. Addressing companies
- e. Special investigators, full or part time
- f. Reports of salesmen
- g. Customers
- h. Banks
- i. Dealers
- j. Advertising departments of periodicals
- k. Accounts in sales ledger

One of the quickest ways to construct a live mailing list of general consumers is to offer something at a reduced price in a magazine, newspaper, or other periodical medium. One of the great mail-order houses obtained its first mailing list from publishing advertisements offering thirty pounds of sugar for a

dollar. Within a few days the company had the names of thousands of people who had demonstrated their willingness to buy direct by mail when exceptional value is offered. Among other ingenious schemes of this sort are prize offers and voting contests.

Valuable mailing lists may be purchased on very short notice from listing agencies and addressing companies. The price of these lists varies with the difficulty of compiling them and ranges from one-half cent to as high as 8 or 10 cents a name. Reputable listing agencies usually guarantee their lists to be from 95 to 98 per cent accurate, according to the nature of the list; and they refund for all "dead letters." In buying "names" it is well to stipulate that letters returned because of wrong or insufficient address shall call for a refund.

5. *Getting a correct list.*—In establishing a list for mailing purposes it pays to spend thought and care to get it correct. One defect in lists compiled from directories is that commonly only the first and last name are given in full; while the middle name is indicated by initials. The John H. Smith of the directory may sign his name in any of various ways. He may prefer to be addressed as "J. H. Smith," or "John Hepburn Smith," or possibly "J. Hepburn Smith." He may also prefer to be addressed with whatever titular degree or other designation he is accustomed to.

The subject of "right names" was investigated by a well-known publishing company. By comparative tests the company found that a list made up of names as customarily signed achieved results  $14\frac{2}{3}$  per cent better than a list copied from a directory.

Oftentimes names and addresses of the same persons are obtainable from different sources and one can be used to check the other.

The nature of the business will to a great extent determine whether other information besides name and address is desirable. In some retail businesses where it is expected to serve the same customer many times, the facts collected by the advertiser concerning birthday dates, political and religious affiliations, size of family and similar matters are numerous.

6. *Keeping lists up-to-date.*—When it is expected to use the lists over and over again, they require continual care. A list, once compiled, never stays put. A good mailing list is the product of a constant evolution. People move away, or die, or change their occupations and the mailing list must be revised or scrapped. The rate of depreciation to which a particular list is subject is determined naturally by the nature of the list. A list of farmers who own their own farms may not vary one per cent a year. At the other extreme, a list of salesmen of cheap specialties may have to be revised every month.

One man's "mailing-list creed" reads as follows: "Every possible customer who is not on my list represents a leak in my future profits: every man on my

list who is not a possible customer represents a leak in present expenses." Constant revising and refining is expensive, but habitual neglect is more expensive.

A local merchant has, in the new editions of local directories, a fairly dependable source from which to revise his list. A national advertiser, however, having on his lists names scattered over small towns and rural districts, may not always find directories available. In such a case, perhaps the best method of checking is to send a copy of the list for each town to the postmaster with the request that he cross off the names of all who have left the town. If the postmaster is tactfully approached he may usually be induced to perform this service, but the law forbids his adding new names to the list.

7. *Filing the mailing cards.*—The necessity of filing cards for mailing lists is patent when we consider the frequency of corrections, of removals, of additions, and of new classifications, especially those new classifications necessary when a prospect has been appealed to or when he has responded to the mail campaign. A certain national concern divides its cards into fifteen distinct classes. Its first three classifications—manufacturers, wholesalers and retailers—are filed together alphabetically, the three classes being distinguished by metallic index tabs. Using cards of different colors is another method of subdividing a file and may be used in co-ordination with the index tabs. The practice of using a single subdivided file is especially commendable where all cards are periodically checked

from directories, rating books, or other alphabetical sources; but it is always commendable in that it saves time in searching for a card. The use of several files usually necessitates a great deal of extra work in duplicating cards for crossfiling.<sup>1</sup>

8. *Sales by mail*.—The components of any mail-selling campaign are usually a series of letters, often with appropriate inclosures. A single letter does not make a campaign. There must be a suitable follow up or the initial effort is largely wasted.

Whether the letters should be composed for climactic effect, or whether the strongest appeal should be made in the first letter, is an important problem in planning the series. A cardinal principle in direct-mail advertising, however, is that each mailing should be sufficient in itself to convince the prospect and induce him to act without awaiting subsequent mailings. Even where the climactic plan is not followed, the time element in the follow-ups deserves attention. The old rule that follow-ups should be sent ten days apart is greater in simplicity than in sales value. In timing follow-ups, importance again attaches to the class of prospects appealed to. A business man answers letters the day they arrive: the farmer or laborer ordinarily is not so prompt.

9. *Raking the list*.—Where an expensive booklet is used to describe the goods, it is not advisable to send out the booklet promiscuously to a large list. Instead,

<sup>1</sup> For further information on filing systems, see Modern Business Text on "Office Management."

a strong appeal should be sent out inviting all interested in securing the booklet to mail an inclosed card. Some companies having only inexpensive booklets have found by investigation that tho more replies come when stamped envelopes are inclosed, the increase of returns may not warrant the additional expense.

Again, to arouse interest in a proposition a series of "mailing pieces" may be sent to a list of names. The mailing pieces consist of cards or circulars designed in striking and elaborate style, each presenting one definite point about the product or its use. In each of them a drive is made for a reply from the prospect. When the reply comes, the mailing of the pieces is of course discontinued. At this point the expensive catalog is sent, or the salesman makes a call.

10. *The trial campaign.*—The list compiled, the letters prepared, and all details of posting decided, it may prove profitable to test the campaign on a representative group of prospects before driving forward on a large scale. An advertiser having a list of, say, 20,000 names may take the first 500 in alphabetical order, and mail his letters to them, keeping careful records of the returns. He may be reasonably certain that his percentage of replies will be about the same from the whole 20,000 as they were from the first 500.

The following figures are from an actual test of a direct-by-mail campaign to secure subscriptions to a publication. The prospects were all bankers. No follow-ups were used. The advertiser established as his minimum twenty orders a thousand; and if a letter

did not "pull" to that extent, he saved himself the expense of sending it to the entire list. The percentage returns from the tests and from the actual mailings were found to be nearly the same.<sup>1</sup>

BANKERS' TESTS  
Minimum Standard 20 per 1,000

Material mailed	No. of pieces mailed	Tests		Mailings		
		Total orders received	No. per 1,000	No. of pieces mailed	Total orders received	No. per 1,000
A2	500	5	10			
B1	500	6	12			
C1	500	4	8			
E	500	7	14			
F1	500	24	36	16,511	589	35
F2	500	12				
G	1000	30	30	21,790	643	29.5
H	500	11	22	{ 6,554 16,039	{ 165 390	24
I	500	12	24			
	500	12		12,154	336	25

Note: Where the same letter appears with different exponents under "material mailed" it indicates that on the test mailing, results were kept separately for the same material mailed to two small groups.

11. *Tests of follow-up series.*—A trial campaign to establish the proper number of letters in a series of follow-ups may require so much time as to be impossible. The advertiser may be compelled to decide from judgment rather than from experiment. He knows that in the first part of the series the succession

<sup>1</sup> "Some problems in market distribution," by A. W. Shaw, *Quarterly Journal of Economics*, Aug., 1912, p. 759.

of appeals will operate to his favor but that a "diminishing return" will operate against him somewhere in the latter part of the series. Just where in the series will one additional letter be unprofitable? The remainder of this chapter is devoted to precisely this question.

Following is a record of seventeen follow-up letters which were sent at weekly intervals to 2,300 dealers in twelve eastern states to induce them to carry the Moneybak Taffeta Selvage Silks, made by the New York Silk Manufacturing Company. The entire campaign cost \$1,554.

<i>Letter No.</i>	<i>Requests for samples</i>	<i>Orders from new accounts</i>
1	1	0
2	5	5
3	4	5
4	3	7
5	8	10
6	3	7
7	6	6
8	6	14
9	2	5
10	5	7
11	16	7
12	7	9
13	7	8
14	4	12
15	3	3
16	3	6
17	10	33

Eleven of these letters, one to eleven inclusive, were used on another list of 4,800 dealers in the remaining

states of the country, with the results shown in the following table:

<i>Letter No.</i>	<i>Requests for samples</i>	<i>Orders from new accounts</i>
1	13	3
2	0	19
3	5	9
4	3	12
5	8	12
6	3	12
7	9	7
8	8	22
9	2	20
10	3	6
11	0	4

12. *Taking the average of a series.*—Another interesting record shows the returns from a series of six letters sent out by an advertising specialist who planned to make a six months' campaign pay on the basis of the net profit from new accounts.

<i>Let- ter No.</i>	<i>Per cent of replies</i>	<i>Per cent of new accounts</i>	<i>Net profit on new accounts</i>	<i>Cost of cam- paign</i>
1	2/3 of 1%	0	0	\$85
2	2%	1/6 of 1%	\$43	85
3	1/6 of 1%	0	0	85
4	1 1/3%	2/3 of 1%	2,570	85
5	3%	2/3 of 1%	427	85
6	7%	3%	2,000	85
Average	2 1/3%	2/3%	Total \$5,040	\$510

If this advertiser had stopped at the end of the third letter, as some might think he would have been justified in doing, he would have nothing but a new loss of

\$212 to show for his efforts. By continuing thruout the series, he was able to obtain new accounts on which he received a net profit of about ten times the cost of the campaign.

### REVIEW

If it costs less to send a letter to a prospect than to send a salesman, why send a salesman at all?

What sources of names for a mailing list could be used in your business?

Could letters be used to facilitate the work of salesmen in your business? If not, why not?

Why must mailing lists be revised?

Devise a system for handling the mailing cards after the mail campaign begins.

How may the effectiveness of sales letters be tested? Why?

## CHAPTER XIII

### SAMPLING

1. *Extent of sampling.*—Sampling has been largely responsible for the success of many standard products. It is one of the oldest kinds of advertising and, when properly used, one of the best. Little has been written about it, however, and few records of sampling results have been published. Probably there is no other branch of advertising on which there is so little available data as on the subject of sampling. The average advertiser knows that there are many forms of sampling, and he realizes that many different things have been put on the market with the aid of sampling. He seldom knows all the ways in which sampling may be used, however, nor has he a clear conception of the widely varying commodities that are susceptible to this particular form of direct advertising.

In this chapter our purpose is to list the chief ways in which products are sampled, and to indicate the possibilities of sampling by naming actual articles that have been introduced by the various methods named. First, we are to consider typical methods of sampling direct by the manufacturer, and then vari-

ous methods of using the dealer to get samples to consumers.

2. *Three general classes of sampling.*—Sampling is divided into three general classes:

- (1) Putting out on trial—the plan adopted in selling talking machines, adding machines and typewriters
- (2) Demonstrating in stores or at fairs where the consumer is allowed to taste the food product or to try the use of the punching bag
- (3) The most common form of sampling; the distributing of packages of the product for the ultimate consumer to use, cook or otherwise demonstrate to his or her own satisfaction.

3. *Sampling thru distribution by other manufacturers.*—Many original methods of sampling have been discovered by clever merchandising men. One of the most successful is that of distributing samples thru other manufacturers. For several years, if you purchased any make of a revolver, you found in the case a neat and attractive sample of Three-In-One Oil. These samples were furnished to the revolver manufacturers without charge, and the revolver manufacturers were glad to distribute the samples in this way, believing that in so doing they were rendering a service to their customers.

4. *House-to-house sampling.*—The oldest method of sampling is to distribute packages from house to house. All sorts of things have been sampled in this

way. An ice company in Kentucky once filled every ice-box in the town with a large-size sample of its goods. More often, however, house-to-house sampling is used for food products, washing preparations and other things that cost little and are used by everyone. Some food manufacturers re-sample a territory every two or three years. This costs much money, but in many cases it has proved profitable.

The success of house-to-house sampling depends largely on the care used by the sampling crew. Each package must get inside the door, because packages left outside are often collected by boys who follow the crew. It is argued, probably with justice, that the housewife who might not take the trouble to go to a store to exchange a coupon for a sample will use a sample if it is left at her home. House-to-house sampling is undoubtedly the most expensive kind of sampling; yet it seems to be the most successful in cities of medium size.

5. *Sampling in public places.*—One of the sampling methods used in distributing Wrigley's gums was sampling in theaters. A perfume manufacturer once arranged with a theater manager to attach a small sample vial of a new brand of perfume to every theater program distributed. The theater is a place where people can be reached in groups.

In cities with a population of a million or over, it is often found advisable to substitute sampling in public places for the house-to-house method. In New York City food manufacturers often place sampling

distributors at the elevated and subway stations at the time of the evening rush when people are leaving their business and going home.

6. *Sampling where representative groups are congregated.*—G. Washington Coffee was first introduced in Atlantic City, and was sampled there for several months during the summer convention season. The manufacturers found, as they expected, that from this sampling a demand for the coffee was soon created in many parts of the country. The Durham Duplex Razor was also sampled at Atlantic City, when a large national convention was held there. Everyone who attended the convention was given a full-size razor with a handle made of papier maché, and carrying one blade only. As most safety razor manufacturers make their profit on the sale of the blades, in order to use the razor more than a few times the recipient was compelled to buy blades from his local distributor. Colgate & Company does extensive sampling of its different products at the large and more representative conventions.

Fairs of all kinds are often used by manufacturers as suitable occasions for sampling.

7. *Demonstrating in consumers' homes.*—Various brands of flour have been pushed in new territories by house-to-house canvassers who call on the housewives, explain the merits of the flour and give a cook-book for an order for flour, to be filled by the purchaser's own grocer. Products demonstrated in this way are usually sold at the full retail price by

the canvassers. Twenty Mule Team Borax and many kinds of baking powder have been introduced in this manner. It may be argued that this is merely direct-to-consumer selling, and not sampling at all. It is purely a form of advertising, because the method of sale is too expensive to be continued after the introductory period, and it has more in common with sampling than with any other kind of advertising.

8. *Lectures and sampling.*—Some manufacturers employ lecturers and demonstrators to appear before women's clubs, schools of home economics and other groups of women, to explain their products, and incidentally, to distribute samples to the people present. Aluminum kitchen utensils have often been sampled in this way. Sometimes, also, the names of the people present at the lecture are taken in order that each person may be followed up by mail.

9. *Sampling in restaurants.*—Some food manufacturers furnish free to all the leading restaurants in a city a sufficient amount of their products for one or two days' supply, and then advertise in the newspapers and in other ways the particular days at which these foods may be found on the menus of the restaurants. This was the plan used in introducing Cream of Rice in Chicago. Uneeda Biscuit was sampled at the Inside Inn at the St. Louis World's Fair in a similar manner.

10. *Sampling influential groups.*—Some manufacturers find they can make no progress without the assistance of certain influential groups, such as doctors

and dentists. These manufacturers provide for systematic sampling to those they wish to influence. Tooth powders and pastes, for example, are largely sampled in this way. National distribution has often been obtained practically by means of this kind of advertising alone. The entire effort is centered on getting the good-will of dentists, for instance, who frequently distribute to their patients the free samples sent to them for this purpose, and who, it is hoped will recommend the use of the sampled preparations.

11. *Sampling direct by mail.*—Many manufacturers obtain lists of the most influential people in each community and send them samples of their products, accompanied by letters explaining the use of the goods. That is usually done after obtaining lists from dealers; some manufacturers, however, find it advisable to make up their own lists. Pluto Water has been introduced in this way in many territories. The Loose-Wiles Biscuit Company has also used this plan in introducing many of its products.

A variation of this scheme is to send samples only when they are asked for. The Horlick's Malted Milk Company sends letters to special lists of prospects, with each letter inclosing a post-card for the prospect to use in asking for a sample if he is interested enough to give it a trial. This method of sampling eliminates waste, and is therefore preferred by many advertisers.

Consumers are sometimes used in compiling lists of people to whom samples are to be sent. The Menth-

latum Company for a time inclosed in each package of mentholatum an addressed post-card for the purchaser to use in sending to the manufacturer the names of friends who might be interested in the product. Sometimes a manufacturer makes a small gift to customers who cooperate with him in this way.

12. *Sampling at factory "house warmings."*—When a manufacturer builds a new factory or establishes a new branch office or warehouse, if his product is of the sort that can be sampled, he often invites the public to a "house warming," and distributes samples to all who attend.

13. *Sampling by using premiums.*—Premiums are given for the return of wrappers and coupons from many kinds of goods. When a product carries premiums, it is common practice for a canvasser to go from house to house, explaining the goods, showing the premium—a set of silverware, perhaps—and telling the housewife that the premium will be given free if she collects a certain number of wrappers or coupons from the manufacturer's products. To enable her to start collecting, the canvasser may give her a free sample wrapper or a complete sample of the goods, or he may give her a sample on condition that she purchases more of the goods from him or from her dealer. One soap manufacturer reports that this is the most successful sampling scheme he has ever used.

14. *Sampling thru dealers.*—The sampling methods thus far described are available to all manu-

facturers, whether they market their goods thru dealers or not. The manufacturer who sells thru dealers, however, has access to many other kinds of sampling. Dealers who know that a manufacturer will treat them fairly, who believe in his product, and who are satisfied with the profit they derive from its sale, are often willing to help the manufacturer distribute samples of the product among their customers for the purpose of increasing its sales. There are several common ways of sampling with the cooperation of dealers.

15. *Sampling with coupons.*—Coupons are used in many ways in the distribution of samples. One frequently used plan is to distribute coupons from house to house or by mail, the coupons to be exchangeable for full-size samples at any store or at certain stores listed on the coupon. This is, in effect, house-to-house sampling, but with most of the waste eliminated. Of course, the manufacturer who uses this method runs the risk of failing to reach many desirable possible customers who will not go to the trouble of turning in a coupon to their grocer in exchange for a free sample, altho they might use samples if the samples were left at their doors.

Another method of using coupons is to publish them in newspapers, instead of distributing them from house to house. A coupon, clipped from the paper and handed to a dealer, entitles a person to a sample of the goods. Sometimes there are no strings what-

ever to the offer; at other times the advertisement specifies that only one sample will be given to an individual or to a family. In still other cases a sample is given for a coupon only if a purchase of the manufacturer's goods is made at the same time; in other words, a coupon and five cents will purchase two five-cent cakes of soap.

Coupons for a new product are sometimes packed with older products of a manufacturer. The purchaser of the older product finds a coupon in it calling for a sample of a new line. He either sends the coupon direct to the manufacturer or, more often, exchanges it for a sample at a dealer's.

16. *Samples free with purchases.*—Instead of requiring the possible customer to present a coupon, some manufacturers authorize dealers to give a sample of a new product to every purchaser of the manufacturer's older goods. For instance, when Violeta Soap was introduced in certain territories grocers were authorized to give away three cakes of the new soap with every twenty-five-cent purchase of any of Armour's other products. Sometimes the offer is a sample free with any purchase, regardless of the kind or value of the goods bought. When Air-Line Honey was introduced in Chicago, the distributors proclaimed an "Air Line Day," when a free sample of the honey was given to every purchaser in every grocery store that handled the goods. Some dealers now advertise "Sampling Days," at which times they

give away samples of various kinds. Many advertisers, however, feel that such wholesale distribution is not profitable.

17. *Sampling in delivery packages.*—Full-size packages of Shredded Wheat have at various times been distributed to dealers, who were asked to include one of the samples in every assortment of goods delivered during a certain period. Some manufacturers find that grocers will not take the time to distribute their samples in this way; in such cases the manufacturer often stations his own men in the large stores to put samples in the delivery packages for the grocer.

18. *Sending samples with other goods.*—Many manufacturers, instead of trying to sample systematically among a dealer's customers, simply send the dealer a few samples in the hope that he will distribute them where they will do the most good. When Wrigley's Doublemint gum was introduced, samples of it were sent with filled orders for the older Spearmint brand. Several sample bottles of Dioxogen were formerly shipped with each dealer's first order of the regular size packages. This is a good plan when the manufacturer can be reasonably sure that the dealer will really give the samples to purchasers.

19. *Sampling at demonstrations.*—A favorite method of sampling is in connection with demonstrations. Manufacturers of food products and toilet preparations often obtain permission to establish demonstration booths in the stores of dealers who handle

the goods to be demonstrated. Here visitors not only actually try the goods, but they are also given samples to take home with them. Crystal Domino Sugar was introduced in this way.

Occasionally manufacturers have thought it best to establish demonstration and sampling booths in stores that do *not* handle the goods displayed at the booths. Food products, for instance, are sometimes introduced thru demonstration booths in department stores that do not have grocery departments. This plan is followed because of the large number of people that visit department stores, and in the belief that this method of distributing will result in the goodwill of small grocers, who might possibly be antagonized by the active work of a manufacturer in the grocery department of one of their large competitors.

20. *Compensation to cooperating dealers.*—A plan for distributing samples thru dealers is always met at the outset by the knowledge that many dealers may not be willing to cooperate. Ordinarily when a dealer is asked merely to distribute small-size samples to his customers, he does not seriously object, altho even in this case some dealers refuse. They may say that they have no time to distribute samples for a manufacturer or they may believe that the distribution of a considerable number of small-size samples will hurt the sale of full-size packages of the goods. This latter objection would not be valid if the samples were distributed only to non-users of the sampled product; but unless care is taken to see that only this

class of people receive the samples, possibly the dealer's sales do suffer.

The chief objection of dealers to the distribution of samples arises when full-size packages of the product are given away. The various coupon methods of sampling, for example, usually provide for free distribution of regular sizes of the goods. The dealer says that every regular-size package given away means just one less package sold. Obviously this position is not always logical. If a non-user gets the sample, he may become a regular user. But, except in the case of new articles, no effective way has been devised to insure free samples going only to non-users. Many manufacturers get around this difficulty by paying the dealer the full retail price for all samples distributed at his store. For example, if a coupon is left with a housewife, and she takes it to her grocer, receiving in exchange a cake of soap that ordinarily sells for five cents, the manufacturer redeems the coupon for five cents, thus not only paying the grocer what the soap cost him, but also giving him the same profit on the transaction that he would have if he sold the soap instead of giving it away. In demonstrations carried on in stores it is customary for the manufacturer who is sampling his goods, if he uses full-size packages, to buy out of the dealer's stock at regular retail prices the goods that he needs for sampling.

There are many variations in the plan of paying dealers to cooperate in the distribution of samples.

The methods that have been described, however, are suggestive of the principles. It may be stated as a general rule that some plan of compensating dealers is almost necessary if their cooperation is expected in the giving away of samples to consumers.

### REVIEW

What are the common characteristics of commodities that can be sampled profitably? What kinds of things, if any, cannot be sampled?

What factors should a manufacturer consider in selecting on a particular sampling plan from among the many different methods that have been used successfully by advertisers?

Could sampling be used in your business? If so, in what form?

Does sampling thru dealers have any advantages over sampling direct to consumers? What obstacles have to be met in sampling thru dealers?

What are the advantages and disadvantages of sampling by means of coupons?

## CHAPTER XIV

### HOW PERIODICALS ARE USED

1. *Place of periodicals in the campaign.*—In previous chapters we have listed the various kinds of periodical mediums and have briefly shown how they are related to the other mediums that are available for the carrying of the advertiser's message. In this chapter we are to consider more in detail the way in which periodicals are used. The periodical is the great advertising medium. To many people the word *advertising* suggests only advertising in newspapers, magazines and other publications. This is too narrow a conception of advertising. Direct mediums and signs are just as legitimate and just as important aids in a campaign as are the various kinds of periodicals. For some commodities, direct mediums or signs may be the only possible methods of reaching the buying public. For others, periodical advertising alone may be unable to accomplish the desired result.

2. *Kinds of newspaper advertising.*—First in volume of advertising carried by periodicals are the newspapers. The newspaper is used by more advertisers, reaches more people, and reaches them more often than any other advertising medium. Newspaper advertising is generally divided into three classes:

1. Local retail advertising
2. Classified advertising
3. Foreign advertising

(a) Local retail advertising. Most newspaper advertising belongs in the first two classes. There are something over three-quarters of a million retail stores in the United States. Many of them do little or no advertising. The larger ones and the successful ones, however, are usually persistent advertisers, and it is their publicity that makes the average newspaper possible. The advantages of newspaper advertising for retail stores no longer need to be argued. The right kind of newspaper advertising pays; thousands and thousands of stores the country over have proved it. If a store is a good store, if it sells good goods and gives good service, only one thing more is essential to success—that the public shall know about the store and what it has to offer. Ordinarily the best and cheapest way to tell the public is thru the newspaper.

(b) Classified advertising. Small advertisements, usually set in small type, of the sort ordinarily known as "Want Ads," are known as classified advertising. These advertisements are usually local in character—positions wanted, positions to be filled, local business opportunities, articles lost and found, etc. Some national advertisers, however, have used classified advertisements effectively. The fact that the "Want Ad" columns are carefully read by certain groups of people, results in a sure, even if not always a large,

audience for the manufacturer who puts his advertising message in those columns.

(c) Foreign advertising in a newspaper is ordinarily the advertising of manufacturers whose plants are located elsewhere than in the city in which the newspaper is published. When modern advertising began to develop, the newspapers were practically the only available mediums for a national campaign. Then came the magazines, and for awhile the newspapers were less used by national advertisers. Of late years, however, manufacturers have more and more used newspapers in connection with magazines and other forms of advertising, and some have used newspapers exclusively. Newspapers offer to the national advertiser an effective method of concentrating a sales appeal in a desirable territory, either at the beginning of a campaign or after the campaign has started and weaknesses have developed in certain localities.

3. *How newspapers are used by manufacturers.*—In selling products of a certain sort, it is often good policy not to attempt to cover the whole country at the start, but to “open up” one jobbing center at a time.

Newspaper advertising may be employed successfully in such a case. The local newspaper campaigns will probably be supported by sampling and the use of other advertising mediums. Grocery specialties are ordinarily introduced in this way. Later,

as in the case of Ivory Soap, for example, the greater part of the advertising appropriation may be spent in the magazines. These advertisers, however, keep close track of the distribution and sale of their products, and whenever they find a city in which per capita consumption is below normal, a concentrated newspaper campaign is often undertaken in order to increase sales locally. Altho some national advertisers use newspapers the year around, most of the "foreign" newspaper advertising appears only for limited periods. The Coca-Cola Company, for example, uses newspapers chiefly when there are conventions or unusual gatherings in a certain city, and it is desirable to reach those in attendance in an intensive way. Other advertisers cultivate a local field by using newspaper advertisements for a period of a month, two months, half a year or longer.

4. *Size of newspaper advertisements.*—The standard newspaper page consists of seven columns of thirteen pica ems ( $2\frac{1}{8}$  inches) in width, and from twenty to twenty-two inches in depth. Very few campaigns will warrant the use of an entire page for each advertisement. Some advertisers make all their newspaper advertisements the same size. In the summer of 1916, Welch's Grape Juice was advertised in a number of newspapers by a series of thirteen advertisements, each one being four columns wide and ten inches deep. One of the advertisements appeared each week. Most advertisers, however, prefer to vary

the size of the space used. At the height of the campaign, larger space is ordinarily used than at other times.

One of the best plans for the use of newspaper space is to standardize a certain proportion between width and depth, and then to vary the size of the individual advertisements in the campaign, while keeping the same proportions in all. For instance, the smallest advertisement might be one column wide and fifty lines deep. A larger advertisement, then, in the same series might be two columns wide and one hundred lines deep. The following table shows the total number of lines (a newspaper "line" is a space one column wide and one-fourteenth of an inch deep) in several sizes of advertisements, all built on the original proportion of one column by fifty lines.

<i>Columns in width</i>	<i>Depth in lines</i>	<i>Depth in inches (approximately)</i>	<i>Total number of lines</i>
1	50	3½	50
2	100	7	200
3	150	10½	450
4	200	14	800
5	250	18½	1250
6	300	21½	1800

Advertisements in a series, all with the same proportions, are called "telescope" advertisements. There are several advantages in their use: The expense of making drawings of different shapes and sizes is saved; the common proportion is pleasing to

the eye; it is possible to achieve uniformity in mechanical layout; and the comparative similarity of appearance helps the reader to recognize the advertisements when he sees them.

5. *Amount of space used in newspapers.*—Some national advertising campaigns in newspapers call for insertions every day, some three times a week, some twice a week, some once a week and some at other intervals. The advertiser must be careful in choosing his days and the frequency of insertion.

The amount of space one can afford to use in the newspaper, the amount of space in each paper to be used in order to secure the desired attention, the length of the campaign, and the frequency of insertions, all depend on the nature of the product advertised, the habits of possible customers in relation to the newspaper, and the size, display and frequency of other advertising in the same newspaper.

6. *Use of magazines.*—The magazine generally is recognized as the great national medium. It is used to advertise products which have a national distribution or national sales possibilities. It is employed for a great number of different kinds of goods. One kind of magazine advertising is that which has for its purpose the sending of consumers to retail stores to buy the products of advertising manufacturers. Perhaps the majority of magazine advertisements are of this sort. Another large group is composed of the advertisements of manufacturers and dealers who do business by mail. Advertisements

in this class may be intended either to induce immediate mail orders, or they may have for their purpose the eliciting of inquiries from possible purchasers, which are followed up by the advertiser and later develop into sales. Inquiries from readers are the primary object, too, of some advertisers whose goods are sold thru dealers; the inquiries are turned over to local dealers after being obtained thru magazine advertising. Other inquiries obtained thru advertising are turned over to the advertiser's salesmen to be developed into sales if possible.

Some magazine advertising has for its chief purpose the obtaining of distribution. The word *distribution* is arbitrarily used by advertisers to refer to the handling of goods by retailers. A manufacturer who is advertising "to get distribution" is trying to induce retailers to handle his product. After distribution is obtained, magazine advertising may be used to increase the good-will and cooperation of dealers.

A few retailers advertise in magazines—ordinarily, tho, only when they want mail orders, or when a chain of stores has retail establishments in many cities. The Woolworth five-and-ten-cent stores, for instance, used magazine advertising to introduce a new brand of yarn to women.

To catalog all the possible uses of magazine advertising would be to state the purposes of the majority of all the national advertising campaigns. There are hundreds of things that can be done with

mediums of large circulation reaching readers all over the country. The magazine more than any other medium, perhaps, has made it possible for the manufacturer to establish a sure market for his goods—to put them in packages, trade-mark them, and then to tell the consuming public about them in such a forceful, attractive way that a steady demand for them is gradually built up. Magazine advertising has been an exceedingly effective tool in bringing the manufacturer and his market close together, in educating the public with respect to new things, in teaching values, and in standardizing the use of hundreds of time and labor-saving devices all over the country.

One of the most extensive magazine campaigns ever conducted was that for the sale of the eleventh edition of the *Encyclopedia Britannica*. Several pages, sometimes with inserts, were used in each issue of a large list of national magazines. The purpose of the campaign was twofold: First, to tell the public about the encyclopedia and to create interest in it; second, to obtain inquiries, which were turned over to salesmen in the field. There was little expectation that direct mail orders would result in sufficient number to pay for the advertising. A few orders came direct by mail; most of the business, however, was obtained thru salesmen. The advertising was a tremendous help to the salesmen in two ways. The inquiries, of course, gave the salesmen direct “leads” in many cases. A man who has taken the trouble to inquire about something that is advertised, and who has re-

ceived a large amount of educational material thru the mail, is an excellent prospect for a salesman. But, even when a salesman called on a possible purchaser who had not sent in an inquiry, the salesman could be reasonably sure that the prospect already knew of the encyclopedia, and that his interest to some extent must have been aroused in it. A very large number of sets of encyclopedia were sold as a result of the excellent advertising supplementing the work of a considerable force of personal salesmen. Certainly the sales would not have been nearly so large if the salesmen had had to work alone, unaided by advertising.

7. *Use of farm journals.*—In 1910 a little over half of the population of the country (53.7 per cent) was rural. While many farmers read the general magazines, magazine circulation is chiefly in the cities and larger towns. Farm journals are probably the best mediums for reaching farm dwellers. The purposes for which farm journals are used does not differ greatly from those for which magazines are utilized. For a long time it was thought that farm publications should be used to advertise only things particularly adaptable to farm use. As a result, the advertising columns featured chiefly farm machinery, farm supplies, household utensils and mail-order advertisements for a variety of things that could be sold readily in the country but not so readily in the cities. Now, however, many advertisers are beginning to realize that farm wants do not differ greatly from city wants,

and that anything in general use can be brought to the attention of farmers thru the medium of the farm journals more effectively than in any other way. Accordingly, the modern farm journal is likely to carry advertisements of breakfast food, clothing, investments, automobiles and all the other many things that are advertised in magazines. These advertisements are often exactly the same as the advertisements used in mediums circulating in the cities.

Farm journals, as has already been said, have for the most part territorial circulation. The extent to which farm journals as a class, and the extent to which any particular farm journal is to be used in a campaign depend on the thing advertised and the nature of the field to be reached. Some things cannot be used on the farm; it would be foolish to tell about them in farm papers. In other cases, the line of least resistance is to go to city dwellers who have ready access to stores handling the advertiser's goods. In some states the farm population is negligible; in Rhode Island, for instance, only three and three-tenths of the population is classed as rural, and in Massachusetts only five and two-tenths. To do much business in North Dakota, on the other hand, the farm trade is absolutely necessary, because eighty-nine per cent of the people in that state are found on the farms and in very small towns.

8. *Use of trade, technical and class publications.*—Trade, technical and class publications are used chiefly in advertising campaigns where it is advisable

to reach and influence a certain class of people. Trade papers, therefore, contain advertisements chiefly of manufacturers and jobbers who wish to induce dealers to handle their goods. A technical publication for dentists carries advertisements chiefly of dental supply houses and of other advertisers who particularly wish the good-will of dentists. A class publication for teachers contains advertisements of books and appliances of particular interest to the teaching profession.

The rate per unit of space per thousand circulation in trade, technical and class publications is usually higher than in newspapers and general magazines. Accordingly, these special-appeal publications in the past have not been generally used for the advertising of articles of general consumption.

Trade papers are often used by manufacturers to tell dealers about advertising that is to be done to try to influence consumers. Other trade paper advertising is designed to induce orders from dealers. Trade paper advertising differs from consumer advertising in that in consumer advertising emphasis is put on the uses and quality of the article advertised, while in dealer advertising the emphasis is put on the profit to the dealer, the amount of consumer advertising that is being used to help the dealer move the goods and the general merchandising policies of the advertiser.

One of the interesting developments of trade paper advertising is the use of space in trade papers by the

proprietors of other advertising mediums. Publishers of farm journals often feel that to assist their advertising patrons properly to distribute merchandise, the dealers must be acquainted with the advertising done in the farm papers; therefore the farm journals are taking liberal space in trade publications to advertise their own publications and their advertisers. One farm journal takes a four-page insert once each month in the leading trade publications reaching the general stores, the grocery stores, the hardware dealers and the implement dealers of his territory. In these pages, the publisher of the farm journal tells the dealers of the new campaigns about to be launched in his publication and reproduces some of the advertisements. This service is furnished without additional charge to all advertisers taking a certain amount of space in the farm publication. A great metropolitan newspaper takes regular space in trade papers each week, listing the products which are advertised in the newspaper and urging dealers to handle and push the advertised goods.

Advertisers are coming to realize the power of the dealer to make or break any advertising campaign, and, as the trade papers increase in prestige and importance, they will be increasingly used as a definite and valuable part of many advertising campaigns.

9. *Use of foreign language publications.*—Only 53.8 per cent of the population of the United States are of native white parentage; 14.5 per cent are foreign born, and an additional 14 per cent are of for-

eign parentage. Many of the foreign born can be reached only by foreign language publications, and these same mediums can be used to reach effectively many others of foreign parentage and of mixed parentage. Primarily a foreign language publication is used by local retail advertisers who are of the same race as the readers of the publication. Other large users of space are the department stores and other retail establishments that have a general appeal, and are as eager to get the trade of those born abroad as they are to get the trade of native Americans. Obviously, a manufacturer making something that would appeal particularly to the people from a certain country would advertise in publications going primarily to those people. Few manufacturers are in this class, however. Nearly everything that is made has an appeal to people of all nationalities; accordingly, the foreign language newspapers are more and more being used by advertising manufacturers in the same way that they use publications in the English language.

10. *Use of directories.*—Some advertisers trace their initial step back to directory advertisements. It is said that among directory advertisers the newspapers find their most profitable field for the development of newspaper advertisers.

Several attempts have been made from time to time to put directory advertising on a basis allowing it to be used in national advertising campaigns. At present, directory advertising is for the most part lo-

cal. Space in the five automobile Blue Books is often purchased by manufacturers engaged in a national campaign, and the time may come when telephone directory advertising will be used in the same way. The possibilities of telephone directories in a national campaign seem to be great. This medium gives a national advertiser an opportunity to publish the names, addresses and telephone numbers of his dealers in each community.

11. *Size of space in periodicals.*—Probably the most difficult thing for any advertiser to determine in planning a campaign in periodicals is the size and space it is advisable for him to use. Some contend that small advertisements inserted often will bring more returns than large advertisements inserted less often. Others say that in the magazine the page is the ideal unit. The 1916 advertising campaign for the Willys-Overland Company was based on an almost universal use of "double-page spreads." As the number of advertisers increases, the size of space of each advertisement appears also to increase. In 1872, the average number of lines per advertisement in the *Century* magazine was thirty-eight; in 1913, the average was 169. In 1890, about one-fifth of the total advertising space used in magazines consisted of full-page advertisements. Today the ratio is better than one-half. In 1880, half-page spaces were used about two and one-half times as often as full-page spaces; in 1890, they were used less than twice as often, and in 1915, about one-half as often.

Professor Walter Dill Scott finds the mortality rate of advertisers is much greater among the users of small space than among the users of large space. He has made a tabulation of all the firms located west of Buffalo which advertised in the *Ladies' Home Journal* during eight years, showing that the advertisers who used the larger size space lasted the longest. The following is the table:

<i>Number of years the firms continued to advertise</i>	<i>Average number of lines used annually by each firm</i>
1 year	56 lines
2 years	116 lines
3 years	168 lines
4 years	194 lines
5 years	192 lines
6 years	262 lines
7 years	218 lines
8 years	600 lines

Professor Scott comments as follows: "This would seem to indicate that, in general, if a firm uses 56 lines annually in the *Ladies' Home Journal*, the results will be so unsatisfactory that it will not try it again. If it uses 116 lines annually, it will be encouraged to attempt it the second year, but will then drop out. If, on the other hand, it uses 600 lines annually, the results will be so satisfactory that it will continue to use the same magazine indefinitely."

#### REVIEW

When and how are newspapers ordinarily used by national advertisers?

Do you know of the use of magazines for other purposes than those listed in this chapter?

If a manufacturer of smoking tobacco were considering mediums for a national advertising campaign, what are the chief arguments for and against his use of technical and class publications?

What kinds of things can be advertised profitably in farm papers?

Why does the publisher of a farm journal sometimes advertise in trade papers?

## CHAPTER XV

### THE USE OF SIGNS

1. *Window trims.*—Experienced advertisers in planning their campaigns seldom overlook anything that can help them to sell their goods. One of the “little things” of a campaign, but also one of the things that can do much to make the rest of the campaign effective, is the furnishing of various kinds of store signs to dealers. It is not enough to get the dealer to handle the goods and then to use periodicals to induce consumers to go to the dealer and ask for the things advertised. If this is all that is done, there is still a gap between the goods on the dealer’s shelf and the impression made on the consumer by the periodical advertising. To bridge this gap the careful advertiser sees to it that there is something in the dealer’s store to remind the visitor of things he has seen advertised in newspapers and magazines, and to stimulate his desire for them.

One of the important ways of aiding the dealer to move the advertiser’s goods from his shelves is to furnish him with display material for his windows. The dealer’s window is a valuable advertising medium. Live dealers realize the value of their windows; they will permit nothing to go into them that

does not possess distinct sales value; and usually they are willing to cooperate with the manufacturer who tries to aid them in selling the things they have in stock. Material that is to be used for display purposes in a dealer's window is called a window trim. Some national advertisers have made the window trim the principal feature of their advertising campaigns. Yale & Towne in introducing the Yale door check made effective use of a modification of the window trim. A Yale door check was placed on the front door of every retail store that had the article for sale. A cut-out paper arrow was pasted on the glass of the door, pointing to the door check, and bearing the words, "This is a complete door. It has a Yale door check affixed." Then black footsteps were stenciled on the sidewalk leading to the door. The door check, the door and the footsteps were reproduced in the national magazine advertising.

2. *The window trim and national sales week.*—Some advertisers plan their campaigns to reach a climax in a certain specified week, and prepare elaborate window trims for dealers during that week. The "Hotpoint drive" illustrates this practice. During Hotpoint Week many thousands of dealers displayed in their windows Hotpoint electrical household appliances, and double-page advertisements appeared at the same time in the magazines. Sunkist Week of the California Fruit Growers' Association called for liberal use of window trims. Large advertisements in color were run in the leading maga-

zines, full-page advertisements were placed in the newspapers, and dealers were furnished with window trim and other kinds of displays. The California Fruit Growers' Association paid for a half-page in each newspaper, with the understanding that the newspaper would obtain advertising of local dealers who handled Sunkist oranges and lemons, to fill the remaining half-page.

Most manufacturers of package goods find it advisable to prepare large dummies of their packages for window trimming purposes. These dummies are usually carried flat and are easily erected.

3. *The use of counter display.*—Another popular form of dealer signs is the counter display. Some advertisers design their packages so that the boxes will make a natural counter display. Robert H. Ingersoll & Brother furnish an attractive counter rack from which Ingersoll watches may be suspended, thus assuring the advertiser that his product is conspicuously brought to the attention of every store visitor.

Dealers prefer counter displays showing the goods themselves rather than signs that merely tell about the goods. One useful type of counter sign is sent out by a manufacturer of underwear. It is obviously impossible to display the underwear itself on a counter sign. The sign is about ten inches long by five inches high and triangular in shape. On the face in metal is the trade-mark name of the article, and on the reverse side, on a metal plate facing the clerk, are

printed instructions regarding sizes and the best method of making a satisfactory fit.

In displaying certain articles, such as notions, counter displays are of great importance. Such an article of this type is likely to be put in a drawer or some other out-of-the-way place unless the manufacturer furnishes a sufficiently attractive display rack. The advertising of the Wisconsin Pearl Button Company centers largely around the cabinet furnished to dealers for the proper display of pearl buttons.

4. *How to get dealers to use signs.*—There is much waste in the distribution of dealer signs. Some manufacturers ship a quantity of signs to every dealer who buys their goods. Many signs sent in this way are never used. Other manufacturers employ their own window trimmers to put up the signs, as it is found that in few cases will the dealer take time to place a window trim or even tack up a shelf card himself. As the life of a window trim is usually not longer than two weeks, some national advertisers, such as W. K. Kellogg and the National Biscuit Company, prefer making displays of dummy packages in the dealer's store above his shelves; these displays are usually left until the next housecleaning day, which may be six months or six years distant.

In 1915, the *Printers' Ink* staff made an investigation of various kinds of dealer signs in an effort to obtain an estimate of their value, the attitude of dealers and the requirements of a successful store display. The following are excerpts from this report:

Several dealers were prevailed on to give a frank statement of their attitude toward manufacturers' counter displays. Among them was Charles Holzhauer, of Newark, New Jersey, one of the leading pharmacists in the state of New Jersey and past president of the New Jersey Pharmaceutical Association. Mr. Holzhauer's idea of counter display hinges principally on the question of profit in the article to be displayed. He brings out the fact that many times a fine display has to be refused by him because he has a similar article under his own name which yields him a better profit. Commenting on the value of the counter display, he said:

"Our counter space is valuable and we must put it to the best use. We use counter-display devices very often where the article does not conflict with other goods, and the profit is good. A great deal of money is wasted, I believe, in getting up material of this sort, which, falling into the dealer's hand, is at once consigned to the ash-barrel because he cannot sell the goods at a profit."

The report of the *Printers' Ink* investigators included records of plans and results of many different kinds of campaigns in which the attempt was made to induce dealers to use the various kinds of store displays furnished by manufacturers. One of the most interesting was the campaign of the Burson Knitting Company, manufacturers of hosiery. The cost of the entire campaign, including everything down to transportation charges, came to a trifle under three dollars a set. The way in which this company convinced 4,000 merchants that it was to their advantage to use the displays furnished by the manufacturer is told by one of the officers of the company:

First, we advertised the display in the trade papers which reached our field. We made it important enough to devote

page spaces to it exclusively. We showed a photograph of the completed display and offered to tell a dealer how to get one. We did not offer to send the outfit, only to tell him how to get it.

To all inquirers we sent a booklet, showing ten different ways in which the material could be combined to make ten different displays—and giving all the arguments for its use. A postcard was inclosed which entitled the dealer to an outfit without charge. The dealer was led first to inquire; then he got the book, which he was able to study at his leisure; and finally, when he thoroly understood the proposition, he was led to ask for the material. If he wasn't convinced that it would pay *him*, he would never ask for it. . . . I have been told by a merchant that I could have his windows for one of our big displays for so much a day. "Thank you," I usually replied, "but if your windows aren't worth any more than that we can't afford to give you the service. This display costs a great deal of money to build, and the company is paying my salary and that of my assistants simply to give this service to those merchants who are important enough to deserve it. If you don't think that your windows are worth a good many times twenty-five dollars a day to you, we'll have to accept your own valuation of them, but we are sorry to say that it isn't high enough to warrant us in placing the display in them."

5. *Most profitable fields for window and counter display.*—The *Printers' Ink* investigation brought out the fact that as many as five different counter displays of well-known advertised brands were found at one time in one of the most exclusive shops in the Wall Street section of New York. Sealpackerchief handkerchiefs, Ingersoll watches, Ever-Ready razors and Paris garters were displayed in most of the leading men's furnishing shops. The report continues:

The hardware field is probably the most lucrative of them all. From interviews with the retailers, they all favor the counter displays and gladly accept them. This is due to the fact that many commodities in the hardware stores are bought on impulse. The dealer is aware of this situation, and realizes the necessity of the counter display. Many of the fine-tool manufacturers realize that in order to have the purchaser appreciate quality they must display the tools in an artistic manner. The L. S. Starrett Company, Athol, Massachusetts, makes a fine display which it sends to the dealers. In order that the dealer may avail himself of this display, it is necessary for him to buy an assorted outfit amounting to \$125. The company makes up several styles of cases; some are placed around the post in the store, others are hung on the wall. Other cases have drawers to hold surplus stock.

Manufacturers are at liberty to draw their own conclusions from the data given. A few general conclusions may, however, be drawn. In order to secure representation, a counter display should fulfil the following conditions:

1. It should be *distinctive*, so that the dealer will feel that it will add something to his store.
2. It must be feature goods which the dealer really wants to sell; i.e., goods which afford him a good margin of profit.
3. It must be presented as a means to help him *sell* more goods; not as a bait to get him to *buy* more.

6. *Cooperating with dealers in buying signs.*—With so many signs constantly offered to them, it is natural for some dealers to fail to realize the expense involved in the preparation of a sign and the actual money loss when a sign is not used or is thrown away. To obviate this difficulty some manufacturers sell their signs to dealers. Of course the number of dealers who will pay for display material advertising a manufacturer's line is much smaller than the num-

ber of those who will use material sent them free. On the other hand, when a dealer pays for displays, the manufacturer can be certain that he will use them. Many dealers realize the value of store displays of various sorts, but, because the cost of a single suitable sign, window trim, or counter display would be almost prohibitive, they would not prepare a sign on their own initiative. The manufacturer is able to order in thousand lots, and can sell the sign to the dealer at a low price.

Sometimes a manufacturer finds out in advance from dealers how many of them will purchase signs, before having them made. He sends a photograph or description of the sign, and agrees to pay half of the cost of the display, perhaps, if the dealer will pay the other half. In such cases the dealer's name is usually printed on the sign as prominently as the manufacturer's if the sign is to be used outside the store. Fence signs, flange signs, posters and street-car cards are often distributed in this way.

It is obvious that if a dealer is to pay his own money for signs, he must keenly appreciate their value and he must have unusual good-will for the things the signs are intended to advertise. The dealer who has an exclusive agency for an article is more likely to buy signs than a dealer who handles a line that is also found in all the other stores in town. One of the well-known manufacturers of talking machines prepares elaborate window trims at the factory, and sells them to dealers for five dollars each.

A common method of making dealers realize the value of display material is to give it to dealers only when they buy a certain quantity of goods. An initial order for a suitable amount of goods may entitle the dealer to a variety of kinds of advertising material, the selection to be made by the dealer and the salesman when the order is taken, or an order of so many cases at any time may entitle the dealer to certain specified kinds and amounts of signs.

Another method of impressing dealers with the value of advertising material sent to them by manufacturers is to require them to pay for the space in local mediums, while the manufacturer furnishes the plates or copy. This applies to street-car cards, newspaper advertising and posters. Sometimes the manufacturer splits the cost of space with his dealers.

7. *The use of posters.*—The poster provides in the advertising campaign the element of large display. It goes out and arrests the attention of the possible consumer wherever he may be. Posters are usually intended to create a strong but a brief impression on the passer-by. The name of the product is strikingly displayed, with perhaps a picture linking up the name with the article or its use, and sometimes a terse selling point or two. The copy must be very brief, because people ordinarily do not stop to gaze at a poster; it must deliver its message while they are passing by. Posters are often used as supplementary mediums in a national campaign. Sometimes in districts where there is much illiteracy or where the pe-

riodicals have limited circulation, the striking poster display is almost the only medium an advertiser can profitably use. Posters have been found especially valuable in advertising motor accessories and automobiles. The appeal of the poster reaches the motorist at a time when he is likely to be thinking about his car and its needs.

Poster advertising space is sold on monthly contract. The advertiser usually furnishes the bill-posting company with the printed or lithographed sheets for posting, providing about twenty per cent more sheets than will be actually displayed in order to cover waste in posting and to permit new postings when old sheets are mutilated or destroyed.

A clever use of posting is employed by the Way Sagless Spring Company. This advertiser "travels" a poster display in Chicago. Monthly contracts are made for posters in different parts of the city. One month the posters appear on the North Side, the next month on the South Side, and the next month on the West Side. Each part of the city is billed regularly, but only for a month at a time.

8. *Use of painted bulletins.*—Painted bulletins may be used in, practically, all the ways in which posters are used. They are ordinarily more expensive than posters except when only a few displays are wanted. In this case the painted display is usually the cheaper because the advertiser is spared the expense of preparing lithographed sheets.

In localities where poster or regular bulletin board

displays are unavailable, advertisers find wall signs of advantage. Many advertisers make a custom of painting the blank walls of their local distributors. Just as it was formerly the custom among farmers to depend on national advertisers for the painting of their barns, so today many dealers rely on national advertisers for the painting of their store buildings. It is not an easy thing for a national advertiser to choose among posters, painted bulletins and wall signs. Most of the larger advertisers employ all three methods, choosing one or another for a community as local conditions may dictate.

9. *Use of street-car cards.*—The street-car card is primarily an urban advertising medium. Altho electric railways are fast stretching their fingers thru the rural districts, street-car advertising up to the present has been planned chiefly to reach the inhabitants of large cities and thickly populated districts. The street-car card is a sign, and is ordinarily used as any other sign—for bold display and small amount of copy, intended to make a quick, strong impression. Nevertheless it is possible to say more on a car card than on almost any other kind of sign medium.

Before 1900 space in street cars was usually sold by individual street railway companies to advertising companies which solicited advertisements locally. Now car advertising all over the country is controlled for the most part by one company. The national ad-

vertiser can buy space in cars in all cities, if he wants to, on a single contract.

The present recognition of the possibilities of street-car advertising is largely attributable to Thomas Balmer. Before he was appointed advertising director of the Street Railways' Advertising Association, street-car cards were usually thought of as permanent signs; very little copy was used and few changes of copy were employed. Mr. Balmer showed advertisers the possibilities of copy on street-car cards, possibilities of teaser campaigns and the advantages of inserting cards in series. Today some large national advertisers use as many as six different cards in the street cars of the same city during a month. A passenger transferring from car to car obtains a new impression or a reenforcement of an old impression in each car he enters.

As our cities become more congested and each individual becomes more dependent on the transit companies, advertisers have been quick to see the great possibilities of reaching people at central points in the transportation system. The elevated and subway posters, which are generally classed with car cards, are fast becoming valuable advertising mediums. Many advertisers who use cards in the cars also use posters carrying the same designs, at the elevated and subway stations.

10. *Parades as advertising mediums.*—The parade may be an advertising medium. When so used, it

should be classed with the other sign mediums. Commercial parades seem to be increasing in popularity, despite the fact that most advertisers furnish floats under protest. A properly representative float for a parade in a large city can seldom be prepared for less than \$200, and some of the most elaborately designed and lighted floats have cost as much as \$20,000. When it is realized that a float is seldom used but once, the question of the advisability of this form of advertising is well worthy of consideration. An advertiser in answering this question should apply the same test that he would apply to any other medium: What is the cost per possible purchaser reached, and what is the prestige of the medium in the minds of possible purchasers? Is the crowd, which will see the float, made up of possible purchasers, and how large will that crowd be? Is the parade of sufficient importance in the minds of those watching it to make lack of representation by any advertiser noticeable?

It has become a custom at the annual convention of the Associated Advertising Clubs of the World to have one large parade. This seems to set the stamp, highest authority, on the value of the parade as an advertising medium. The parade is purely a supplementary medium. It is of little value unless the advertiser is already known to his audience, because it is impossible in a parade to do more than give bold display to a name, a product or an idea.

## REVIEW

Should a manufacturer pay a dealer for the use of window space to advertise the manufacturer's goods? Why?

What particular kind of inside store sign would be best for a breakfast food? A brand of cigars? Shoes? Carpenters' tools?

What is your opinion of the value of advertising in moving-picture theaters? Remember that different things influence different people. Be careful not to let possible personal prejudices influence your business judgment.

What are the things that induce a dealer to use store signs supplied by manufacturers?

How can the various kinds of sign advertising be closely connected with periodical advertising?

## CHAPTER XVI

### CAMPAIGNS TO OBTAIN DISTRIBUTION

1. *Four kinds of campaigns.*—Thus far in our study of advertising campaigns we have considered the elements of the campaign and the uses to which different advertising mediums are put. Now we are to consider the various things the campaign may accomplish and the ways in which the advertiser adapts publicity methods to make them conform to his particular purposes.

In general, there are four distinct kinds of advertising campaigns, apart from the campaigns of retail stores:

1. Campaigns to obtain distribution
2. Campaigns to obtain dealer cooperation
3. Mail-order campaigns
4. Campaigns to influence public sentiment.

In the present chapter and in the three that follow it, we are to study separately each of the four principal classes of advertising campaigns. We are concerned, first, with campaigns to obtain distribution.

2. *Should advertising precede distribution?*—For years advertisers have sought a universally applicable answer to the question, "Shall I advertise in order to

obtain distribution, or shall I try to get distribution before I advertise?" The manufacturer who advertises to consumers before he has general distribution of his product, believes that he cannot induce dealers to stock his goods until the dealers have seen his efforts to create consumer demand or until consumers have proved that there is a demand by actually going into stores and asking for the advertised goods.

It is clear, however, that advertising preceding distribution is bound to result in much waste. If a consumer has his interest and desire for a new product aroused, asks his dealer for it, and is told that the latter does not carry it, he may not be willing to wait until the dealer can order it for him. The newly aroused interest is likely to be killed. Furthermore, most advertisers find that advertising in periodicals alone is often not enough to arouse interest in something new; it must be supplemented by store signs and the active work of the dealer. For these reasons many manufacturers try to get general distribution for their goods before doing a great deal to bring people into stores to ask for them.

The problem of whether advertising or distribution should come first seems to be similar to the problem of the Irishman's boots; they were so tight he could not get them on until he had worn them a year. The problem is not unsolvable, however. If it were, there would be no successful advertising campaigns. Advertisers now recognize that neither distribution nor advertising must necessarily come first; in many cases

it is possible to get distribution and to arouse consumer interest simultaneously. Mr. William H. Ingersoll says, in *Printers' Ink*:

Neither distribution nor demand can precede the other without loss. If we are going to wait for distribution, we shall wait forever, or nearly forever. On the other hand, if we are going to create a demand without distribution, without advertising—then again we are going to delay the time that we reach the success to which we are entitled. In other words, the most economical, most efficient way, in my opinion, of handling this subject of distribution and demand is to go ahead in a moderate way and advertise, take the sales methods that are at hand, and keep the demand going by getting all the distribution you can.

Dealers are influenced both by advertising that is being used and by advertising which the manufacturer convinces them he is about to use. Salesmen often carry portfolios of present or projected advertising, which they show to dealers as evidence of the part the manufacturer is willing to play in helping dealers to move goods from their shelves. These portfolios sometimes show not only the advertisements themselves, the list of mediums and the dates when the advertisements are to appear, but also the circulation of every medium in each dealer's own town.

3. *Starting on a small scale.*—It is not necessary for a manufacturer to begin his consumer campaign with national advertising. An article of universal consumption is seldom introduced in all parts of the country at the same time. Ordinarily a relatively small territory is selected as a "tryout market." In-

tensive sales effort is used there to interest dealers, and this is backed by various kinds of local advertising. It is entirely possible to send a force of salesmen to a certain city to work with the dealers, and to start a newspaper, street-car and poster campaign in the same city simultaneously with the arrival of the salesmen.

Consider the problem of a manufacturer of flour. Unless he had tremendous resources he would not consider attempting a national campaign until he had built up distribution and consumer demand by starting out in a single center, and then branching out gradually into adjacent territories. If he were strong enough to begin with a section of the country instead of with a small section of a state, he might plan his campaign so as to make the successive steps in its development coincide with the divisions of the country recognized by the Federal Reserve bank system. There are twelve Federal Reserve banks, each centering a district which is largely tributary to it. If large sections of the country are to be used as units in the campaign, probably no better divisions than those established by the Federal banking system could be found. The accompanying map shows the twelve divisions of the country, the amount paid for flour by consumers, and the percentage of total consumption which is represented by the expenditures for flour in each district.

4. *A flour campaign.*—A manufacturer usually commences with his home territory as a tryout mar-

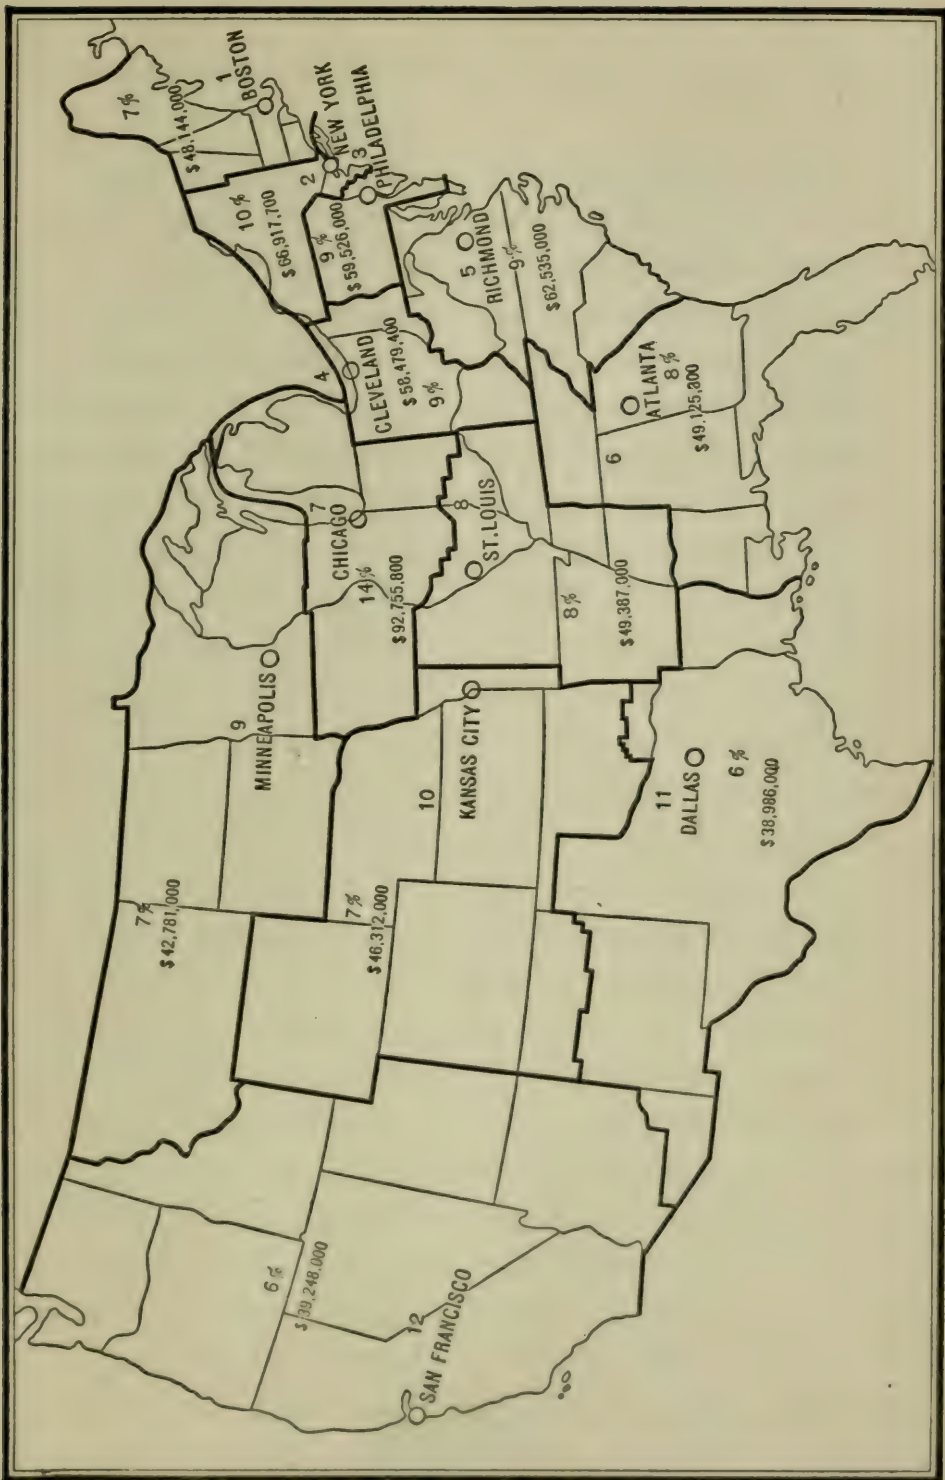

ket. Assume that a flour manufacturer has a factory in Kansas City, the center of Federal Bank District No. 10. He will send salesmen to dealers, and he will choose advertising mediums reaching flour consumers in Kansas, Nebraska, Wyoming, Colorado, and parts of New Mexico, Oklahoma and Missouri. After he has worked up his business in this district, he will probably expand into Federal District No. 8, establishing a district agency in St. Louis in an effort to obtain his share of the \$49,000,000 market in this district.

Other conditions being favorable, he may next consider the Chicago district, the Dallas district or the Minneapolis district. In each case he will use localized mediums, such as newspapers, billboards, street cars and farm papers supplemented by sampling and possibly direct-by-mail advertising, repeating the same campaign, changed to fit local conditions, in each territory.

After the manufacturer has covered, say, six or eight of the trade territories, and has obtained what he considers satisfactory distribution in each, he will be in a position to consider national advertising, using national magazines, national farm journals, a schedule of national posters, or a schedule of the leading newspapers in the large cities, the circulation of which linked together will blanket the country.

In this case, as in many others, national advertising follows a long period of local advertising coupled with careful cultivation of dealers. For many prod-

ESTIMATED CONSUMPTION OF FLOUR IN UNITED STATES

ucts any other plan than this would be too wasteful and too expensive.

5. *Distribution for an article of limited consumption.*—In marketing an automobile accessory, a manufacturer would proceed in a very different way from that in which a flour campaign would have to be conducted. National advertising could begin almost at once, because he could bring a direct appeal to all the possible distributors within a short time. Instead of a total of 25,000,000 families and 350,000 dealers, as in the case of the flour manufacturer, the total consumer market would be only about 2,500,000. Approximately 20,000 dealers in automobile supplies would have to be reached. He might send salesmen to dealers in the larger cities, and appeal to the others by direct advertising of various sorts—strong sales letters, a catalog and reproductions of the consumer advertising. Probably he would also use the advertising columns of the trade papers in order to talk directly with dealers.

6. *Dangers of overstocking.*—Some manufacturers in their eagerness to make large sales to dealers, induce them to buy more goods than they can sell within a reasonable time. At the beginning of a campaign the dealer is seldom in a position to determine for himself just how many of the new products he will be likely to sell. The manufacturer should see that he does not stock too heavily. An overstock often means the loss of the dealer's good-will, and it usually results in disastrous price-cutting. The men

who are overstocked and who cut prices will scarcely be willing to order again when their stock is gone, and the dealers who do not cut prices will see their trade leaving them and will focus their resentment on the goods. In either case, the manufacturer loses. A manufacturer does not conduct an elaborate campaign to induce first sales only; his profits must come from reorders, and reorders are received only when the dealer has been treated fairly—when prices and profits are right, when the manufacturer has done his part to interest consumers, and when the dealer's first stock has been large enough to satisfy immediate demands but small enough to permit a rapid turnover of the money invested in it.

The Procter & Gamble Company, when it introduced Crisco, sent free to every grocer in the country six cans of the product. Gratuitous distribution of small sample stocks is certainly an almost ideal way of inducing dealers to handle a new line of goods, but it is too expensive for many manufacturers to use.

7. *When distribution preceded advertising.*—When, in 1906, William Wrigley, Jr., jumped into advertising with an appropriation of \$250,000, many people called it plunging. They did not know about the long years of preparatory work in an effort to obtain a nation-wide distribution. Practically all the \$250,000 was spent in out-door display, street-car cards and window trims. Before a cent of this appropriation was spent almost complete distribution

had been obtained thru direct advertising to dealers. Mr. Wrigley started in business with a capital of \$32. He attempted distribution thru premiums. His first venture was in lamp chimneys. He filled lamp chimneys full of gum and sold the gum, throwing in the lamp chimney. He studied dealers, and offered as premiums the things they really wanted. A certain retail grocer needed, say, a special counter scale. Along came a circular from Wrigley offering an attractive scale free if the grocer would go to his wholesaler and buy \$15 worth of gum.

Thus, step by step, Wrigley obtained a foothold. Then he established a great direct-by-mail advertising campaign to dealers. Multigraphed circulars were mailed every thirty days to 250,000 dealers whom Mr. Wrigley wished to get into line. If 12,000 of these prospects were turned into customers in any given month and the prospect list thus reduced to 238,000, an addition was immediately made to the list so that the number of names was brought up to 250,000. The list of dealer prospects was always maintained at the 250,000 mark.

The national advertising did not commence until the company had been in business fourteen years. Therefore, when the quarter of a million advertising campaign was undertaken, the foundation of distribution had been laid. This foundation was laid so successfully and the business showed such a fast, steady increase after the national advertising had appeared,

that before the end of 1916 the company was spending two million dollars a year in advertising.

8. *Using established good-will to obtain distribution.*—When Mr. Wrigley put Doublemint gum on the market, he was able to use the thousands of dealers who were already handling his earlier brand. In less than sixty days 500,000 distributors for the new gum were obtained. These were enlisted from the 800,000 who were then selling Spearmint. Each of these 800,000 received a coupon entitling him to one box of the new gum, provided the dealer handed it to his jobber with an order for one box of Spearmint before the time-limit indicated on the coupon expired.

The William Wrigley, Jr., Company redeemed these coupons from the jobbers at the regular price of sixty cents a box, thus allowing the jobber his usual twelve cents profit; or, to put it in another way, the company paid the jobber twelve cents to deliver the sample box to the dealer. The expense was very great; in all, \$300,000 was paid out in redemption money to secure distribution, but for every box of the new gum given away, a box of the old brand was sold; in this way the expense was largely offset. The plan enabled the company to take advantage of distribution already secured, and this immediate distribution made possible immediate consumer advertising on a national scale. Furthermore, by getting immediate distribution the danger of substitution was greatly reduced. If the company had started to advertise

with haphazard distribution, dealers might have been inclined to talk their customers into using other gums, and the new brand would have been deprived of an opportunity to demonstrate its merit.

### REVIEW

Should distribution or consumer advertising come first?

Is it wise to try to introduce a new product in all parts of the country at once? Why? What is the alternative?

Is it advisable to launch a new article by selling it both to dealers and consumers at a special introductory low price? What would be your probable action if you paid twenty cents for a new shaving soap, only to find when you re-ordered that the price was twenty-five cents?

Some people contend that a dealer should be stocked just as heavily as possible with a new line of goods, on the theory that the more he has, the harder he will try to sell them. What do you think of this policy? Would your answer be different if the question referred to an old, long established line of goods which the dealer had handled for years?

## CHAPTER XVII

### CAMPAIGNS TO OBTAIN DEALER COOPERATION

1. *Place of dealer in the campaign.*—The attitude of the dealer is one of the vital considerations in planning an advertising campaign. The success of the campaign depends to a great extent on the degree to which dealers will be willing to cooperate with the manufacturer in the sale of his goods. Sometimes the dealer will not cooperate. If he is openly antagonistic, the campaign can scarcely be successful; if he is indifferent, success can be bought only at a great price. Some manufacturers seem to think the dealer owes them cooperation—that he should lend his active efforts to encourage any sort of campaign for the promoting of sales thru retail stores. This attitude on the part of manufacturers is responsible for much dealer antagonism. The dealer resents attempts at coercion; he resents the implication that he must give his active support to any manufacturer simply because the manufacturer elects to distribute thru the dealer and conducts some sort of campaign to help the dealer sell his goods.

Dealers cannot handle every line that is offered them; they must make careful selection from the almost countless things that manufacturers seek to in-

duce them to push; and they are likely to put their efforts behind the products of those manufacturers who wisely seek cooperation by proving themselves most willing to cooperate unselfishly with dealers. The attitude of the advertiser and the dealer toward each other is more wholesome than it used to be, but there is still room for improvement in the understanding of the dealer by the advertiser and in the understanding of the advertiser by the dealer.

2. *Three periods of dealer cooperation.*—At the beginning of the twentieth century many manufacturers seemed to think the attitude of the dealer did not count—that the force of advertising with resulting demand on the part of consumer would require dealers to handle advertised goods, and that competition among dealers for the trade in such lines would make it necessary for each dealer to push them. This was the period of “Force the dealer.” There was much talk about using advertising as a club to compel the sale of advertised goods, whether dealers wanted to sell them or not. Some advertisers were successful in “forcing the dealer,” altho at very great cost. Others found that it is unwise to try to make dealers do something they do not want to do. It was discovered that many dealers can induce their customers to buy what they recommend, regardless of an original intention on the part of consumers to buy something else. “Forcing the dealer” in general proved to be an expensive and wasteful method of inducing sales, even in the few cases in which it was successful.

3. *Period of "Bluff the dealer."*—Following the "Force the dealer" period, which lasted for about ten years, came another, similar to it, but marking a sort of half-way stage between the crude methods of the early days and the more intelligent methods of obtaining cooperation in vogue today. This might be called the period of "Bluff the dealer." The advertiser began to have some conception of the dealer's attitude; he did not ignore the dealer's opinions—he did not merely advertise to consumers and trust to consumer demand to force the dealer into line. He began to cater to the dealer and to try to make him eager to have a part in the large sales which were expected as a result of the manufacturer's advertising. He did this by talking grandly to the dealer about the large scale of the projected advertising campaign. He took space for his consumer advertisements in mediums that the dealers were sure to read. He did everything, in short, to impress the dealer with the importance of the manufacturer and with the size and probable effectiveness of his advertising. The advertiser was not really bluffing; he really carried out his largely advertised advertising plans, but he deluded himself, and he tried to delude the dealer, into thinking that those plans, with nothing added, were enough by themselves to deserve and to obtain the cooperation of the trade.

4. *Period of "Help the dealer."*—The third and the present period of dealer cooperation is the period of "Help the dealer." Its basis is the idea that dealers

must be helped and educated, rather than forced or bluffed. The period came into existence when advertisers generally began to realize that the dealer is not a mere distributing machine, but that he is a powerful force to be reckoned with. In the early days of national advertising, "consumer demand" was assumed to be a thing of prime importance. If enough consumers could be influenced to want advertised goods, the problem of the dealers would take care of itself. We hear less of consumer demand nowadays. The modern phrase is "consumer acceptance." National advertising is no longer expected to do all the work of making sales. It has been proved in many instances that advertising does not create such an intense desire for advertised articles that consumers insist on having those articles or nothing. Dealers can and do switch demand; they can and do exert a tremendous influence on what consumers buy. The function of national advertising is no longer simply to cause consumers to "demand" advertised goods; its chief function often is to impress advertised goods on the minds of consumers so forcefully that when those goods are suggested to him by dealers, the dealer suggestions, added to the impression created by the advertising, will induce him quickly and with little sales effort to "accept" them.

Of course, consumer acceptance is not the sole purpose of all consumer campaigns for products sold thru dealers. Yet it is sufficiently universal and sufficiently important a purpose to color almost all the

modern attempts to obtain dealer cooperation. If the dealer is to do his part in inducing consumer acceptance, he must have a degree of good-will toward the manufacturer and his goods which is very different from his former frequent attitude of resentment or indifference.

5. *The spirit of sales cooperation.*—There are many methods of inducing dealers to push advertised goods. At the bottom of all the successful ones, however, there is one common characteristic. The manufacturer who really gets active good-will is the one who convinces dealers that he is willing to help them if they will help him. He shows that the things he asks the dealer to do are calculated to help the dealer at least as much as they help the manufacturer; and, in the most successful campaigns, service to dealers greatly overshadows the manufacturer's desire to increase immediately the sale of his goods. Of course, whenever a manufacturer really helps a dealer, he creates good-will that is bound to result in his favor, and, if the help takes the form of education in better business methods, those methods will help the manufacturer just as much as they will help the dealer.

6. *Influence of quality of goods.*—The manufacturer who wants dealer cooperation must first see to it that the quality of his goods is such that the retailer will recognize it and the retailer's customers will be satisfied with their purchases. The retailer wants permanent trade; he can get it only when his customers are pleased with their purchases and come back

for more. Therefore, the first thing the dealer looks for is quality.

7. *Profit as an inducement to cooperate.*—After quality, the dealer wants profit. The price he pays for goods and the price at which he can sell them must be far enough apart to cover all his expenses of doing business and to leave him a satisfactory profit besides. Many advertising campaigns have failed because the item of profit was overlooked or because the margin allowed was too small. No matter how much a manufacturer tries to help dealers to sell his goods, no matter how effective his advertising, no matter how much quality he puts into the line, if the profit is not right the dealer will not cooperate.

8. *Importance of quick stock turnovers.*—After quality and profit, the dealer wants to be assured regarding the ease with which the goods will sell. Modern merchandising requires small stocks and quick turnovers. Besides putting quality into his goods and selling them at the right price, the manufacturer can help the dealer to achieve quick turnovers in two ways: First, he can adopt some selling plan that will make complete stocks of his goods easily accessible to dealers, so they can order frequently and in small quantities. Second, he can help the dealer to move the goods off his shelves. In achieving this second purpose advertising has the chief part. Various methods of inducing dealer cooperation by means of advertising are described in the following pages.

9. *Educating the dealer and his sales people.*—

One of the best ways of arousing the interest of dealers is to teach them the points of interest about the things they sell. A carpet manufacturer sent to all his dealers and their sales people a booklet entitled, "What I Learned About Carpets." It told in a lively way the experiences of a retail salesman who visited a carpet factory for the first time. Certainly the retailer who read this story could sell carpets more intelligently than he could before, and he would feel a real interest in the manufacturer who had helped him learn more about his goods. Many manufacturers go to great lengths to interest dealers in their lines by teaching them the selling points. Moving pictures of manufacturing processes are displayed before groups of store employes; booklets are distributed; traveling exhibits are routed from store to store; salesmen give lectures to buyers and sales people; and many similar methods are used to obtain cooperation by arousing interest.

A new kind of education for retailers has for its purpose, not primarily increased sales of any given manufacturer's goods, but, rather, increased sales and increased profits for the dealer in his business as a whole. The Printz-Biederman Company, manufacturers of women's garments, offers a complete correspondence course in retail selling for the employes of the suit and cloak departments of its dealers. The course is a broad one; it teaches the best methods of selling women's garments in general, and refers only incidentally to the product of the company that prepared

the course. A manufacturer of sad-irons formerly distributed a correspondence course in advertising for the retail dealer, covering everything from study of the market to copy-writing, methods of display and the selection of mediums. The manufacturer of Ingersoll watches prepared, and distributed free to his dealers, a complete system of cost accounting for jewelry stores. Broad-minded, unselfish educational efforts of this sort represent a long step in advertising from the days when "Force the dealer" was the slogan. They promise much for the future of dealer-manufacturer relations.

10. *Campaigns to increase the sales of related products.*—Strategy in advertising is expressed in a variety of ways. The advertiser who offers a free course in accounting for his dealers is a strategist of the first order. His final, and legitimately selfish, purpose is entirely overshadowed by an unselfish desire to be of real service to his distributors. In the same class is the manufacturer of one product who advertises another for the benefit of his dealers. They both represent a broad-minded American principle of far-sighted, business helpfulness. They both prove the growing realization in business of the old truth that the one who profits most is the one who serves most.

The Bemis Bag Company manufactures containers for flour. Yet it does not advertise bags. It advertises to increase the consumption of flour, because its business can increase only as the business of the

millers of the country increases as the number of consumers increases. The Bemis Company publishes advertisements in the leading magazines and newspapers showing the nutriment in white flour, and urging housewives to make more liberal use of it. The object of the campaign is twofold. First, the obvious object is to increase the consumption of white flour, if that is possible. But the other object, and the one which is undoubtedly a great deal more definitely realized, is to get the good-will of millers. The miller feels that the manufacturer is attempting to render him a real service. The manufacturer does not come to the miller saying, "I want your bag business." He says, "I'm going to do everything I can to increase your flour business. Then you will have to use more bags. If you buy them from me, I shall appreciate it. I expect to succeed only by assisting you to success."

Thru advertising, the business men of the country in all lines, whether they are retailers, jobbers or manufacturers, are coming to understand one another better, and to know the real meaning of cooperation and service.

11. *Three kinds of "dealer helps."*—The forms of advertising most generally used by a manufacturer in his effort to gain dealer cooperation are those that help the dealer to tell the public about the manufacturer's goods. These helps, aside from the educational work already described, are of three kinds—store signs, assistance of various sorts in the retailer's

newspaper advertising and assistance in his direct advertising.

12. *Dealers' newspaper advertising.*—One of the first attempts of manufacturers to obtain dealer co-operation was by offering assistance to retailers in the preparation of their newspaper advertising. The average retailer has had little opportunity to study advertising carefully; or he is usually busy with a multitude of store details, and he thinks he has not the time to devote to the writing of advertisements, even if he had the training to do so. As a result of these two conditions much retail advertising up to a few years ago, particularly in the smaller communities, was weak and ineffective. Taking advantage of this situation, national advertisers offered to help the retailer produce advertisements that would really attract trade.

The first kind of advertising help offered to the dealer was a complete advertisement of a manufacturer's goods, electrotyped and ready for insertion in the dealer's papers, with only a small place left blank for the dealer's name and address. Complete advertisements of this sort have been, and still are, widely used. Many manufacturers prepare them and many dealers use them. This advertising is often better than the dealer could prepare for himself, and sometimes the dealer would use no newspaper advertising at all if it were not for the plated advertisements he receives from manufacturers. To that extent, the material is valuable.

It has the great disadvantage, however, of representing the manufacturer and his goods rather than the dealer and his store. An advertisement prepared for a thousand stores can certainly not reflect the individuality of any one of them. A realization of this fact is inducing many dealers to refuse to use plated advertisements from manufacturers, and it is inducing many manufacturers to find some other methods of bringing about dealer cooperation. The sincere, frank recommendation of the dealer, no matter how crudely expressed, is often worth much more to the readers of a paper than even the strongest appeal of an advertisement obviously written by a manufacturer.

13. *Advertisements that represent the dealer.*—When the manufacturer wishes to present complete advertisements to his distributors, a better plan than the sending of electrotyped advertisements is to send sheets of paper to the dealer, showing suggested advertisements of the manufacturer's goods. The dealer can use the suggested wording if he wants to, or he can change it to suit himself. When cuts are used the dealer can get them on request or for a nominal charge. Dealers like this kind of advertising assistance. The only objection to it from the manufacturer's point of view is that most dealers, when they use the suggested advertisements at all, use them without alteration. To this extent, this advertising is open to the same objections as the older type of plated advertisements.

Complete advertisements furnished to dealers, either plated or simply printed as suggestions, may deal entirely with the goods of the manufacturers supplying them, or they may contain sales talk about other things in the dealer's stock. In the former case, many dealers resent the obvious selfishness of the manufacturer's appeal. They are much more likely to give their support to a manufacturer who helps them sell other things in addition to his own product.

Some manufacturers supply dealers with complete advertisements, but make no attempt to prepare stock advertisements. When a retailer asks help, his store and his particular problems are studied by correspondence and thru the reports of salesmen. As a result the manufacturer's advertisement department is able to write advertisements that just as truly represent the dealer as if he wrote them himself. This kind of assistance is about the maximum of advertising service that a manufacturer can give a retailer in his attempt to obtain cooperation. For many manufacturers, however, it is prohibitively expensive.

14. *Furnishing parts of advertisements.*—The majority of advertisers have abandoned the attempt to supply dealers with complete newspaper advertisements. A common practice now is to furnish cuts for illustrations only. The dealer receives sheets showing stock cuts illustrating the manufacturer's goods. He selects what he wants and uses them in any way he wants to in his advertisements. A commendable modification of this practice is to send with

the book of cuts suggested sentences or paragraphs that can be used by the dealer when he publishes the cuts. If these paragraphs are written in a lively way, and if the dealer is assured that they are merely intended to help him and not to bind him to any particular phraseology, he is likely to use them.

Several stove manufacturers have made a practice of furnishing cuts illustrating almost everything in a retail hardware store, and even of writing copy to go with the cuts. They asked nothing for the services, merely putting their own trade-marks, often in inconspicuous places, on the cuts or copy furnished.

Some manufacturers furnish street-car cards and sheets for bill-posting to dealers who use these mediums. Others simply make suggestions for any kind of advertising a dealer may wish to undertake.

15. *Assistance in dealers' direct advertising.*—Many retailers find that direct advertising to their customers or possible customers, either alone or in combination with newspaper and sign advertising, is a valuable method of building business. They often find it just as difficult to prepare their own direct advertising, however, as to prepare their newspaper advertisements. Accordingly, some manufacturers help them in this form of publicity. The great clothing companies send out style books to lists of names furnished them by their dealers. Each book carries the dealer's imprint, and usually is accompanied by a letter, prepared by the manufacturer, but signed by the dealer. Modifications of this plan are used by man-

ufacturers in other lines. Doubtless the plan is effective, but great care must be used if the manufacturer wishes consumers really to believe that the direct advertising carries the sincere indorsement of his local dealer. A dealer's direct advertising that is obviously furnished by a manufacturer is not so effective as that which carries some ear-marks of the dealer's personality.

16. *Manufacturers' consumer advertising.*—We have described a number of ways in which advertising may be used by a manufacturer to induce dealers to cooperate with him in the sale of his goods. All of them are good when employed wisely, and all of them are widely used. But none of the special forms of inducements to dealers should blind the manufacturer to the greatest inducement of all—persistent, effective advertising by the manufacturer, directed toward the consumer, slowly but steadily making the manufacturer, his goods, his trade-mark and his selling points known to the public and, if not actually creating insistent consumer demand, at least paving the way for ready acceptance of the manufacturer's product when any effort at all is put behind it by the dealer. This form of advertising assistance, more than any other, helps the dealer to make sales quickly and at little expense, and, when it is used for a product that has quality and that gives the dealer a satisfactory profit, it is usually successful in inducing valuable cooperation.

Several years ago the Northern Pine Manufactur-

ers' Association tried to overcome the shrinking demand for pine by advertising to the trade only. The results of the campaign were not satisfactory, and the world of housebuilders was left to persist in its belief that all the white pine was used up, or, if some was left, that it was too expensive for ordinary use. The Southern Cypress Manufacturers' Association, realizing that "the consumer is king," began to advertise to win the patronage of consumers in 1910. National magazines and farm journals were used extensively. In all, an aggregate of 5,500,000 circulation was employed in consumer publicity. The result has been a large increase in the use of cypress. The association purchased space in the trade publications, not so much for the purpose of urging the trade to use more cypress, as to explain to the trade the consumer advertising it was conducting.

This successful experience of the Southern Cypress Manufacturers' Association led to the organization among the Northern Pine Manufacturers' Association of a white pine bureau, which in May, 1915, began to advertise the advantages of white pine to consumers. The effort was successful from the start. Dealers, realizing that the manufacturers were advertising to increase their sales, put forth additional effort, began to use the dealer helps furnished them, and even inaugurated campaigns of their own in local territories to counteract the impression that the supply of white pine is exhausted, and to show the advantages of white pine over other woods.

Dealers' cooperation can be obtained by hard work, fair treatment and a real willingness to serve. But the dealer does not ordinarily give full cooperation unless the manufacturer does his part by advertising to the consumer.

17. *Dealers meet advertisers half-way.*—The degree of cooperation that may be expected from intelligent effort on the part of manufacturers is indicated by the success of "national advertising weeks," fostered by some of the magazines in cooperation with manufacturers. The plan is for the dealers in a town during a "national advertising week" to feature nationally advertised goods in their stores, their windows and their newspaper advertising. During such a week one dealer turned a whole floor of his store into a special exhibit of 115 booths showing nationally advertised goods. Each booth was in charge of a demonstrator. The manufacturers bore the expense of decorating and equipping the booths. In return, the dealer spent \$10,000 of his own money in newspaper advertising and in furnishing heat, light and special sales people. Every visitor to a booth signed a register. The names were later furnished to the manufacturers, who agreed to send direct advertising to these persons. The results were satisfactory both to the manufacturers and to the dealer.

All retailers cannot cooperate in this extensive way, but most of them, to the extent that their resources permit, are willing to cooperate with manufacturers who give them quality and profit, and who offer in-

telligent help in solving the great problem of attracting and holding trade.

## REVIEW

What is the difference between "consumer demand" and "consumer acceptance"?

What are the things, apart from advertising, that tend to induce dealer cooperation?

If you were a retailer, what tests would you apply in determining the relative acceptability of the many things manufacturers would offer to do for you to obtain your cooperation?

If the business with which you are connected sells a product or service thru distributors, how is their cooperation obtained? How might it be obtained?

How does dealer distribution differ from dealer cooperation? Can the same methods be used in obtaining both?

## CHAPTER XVIII

### MAIL-ORDER CAMPAIGNS

1. *Kinds of mail-order campaigns.*—There are three general kinds of mail-order campaigns: (1) The campaign of a mail-order specialty house, which sells one line of goods or service, or several closely allied lines, and which uses the mails to make sales as part of the established house policy. In this class are mail-order distributors of jewelry, furs, clothing, food products and thousands of other things sold to consumers by mail. (2) Similar to the campaign of the mail-order specialty house is that of a manufacturer who introduces his goods to consumers by mail, but who later expects to distribute them thru dealers. (3) The third kind of mail-order campaigns is conducted by the establishment that tries to sell a great variety of different kinds of things by mail. In this class are such mail-order distributors as Sears, Roebuck & Company, Montgomery Ward & Company, and the many city department stores that sell by mail as well as over the counter.

As far as purpose and method are concerned, the first two classes may be grouped together. The purpose of both is to make sales as the direct result of

the advertisements. Frequently the reader is urged to send his money or to order at once, usually with the promise that the money will be refunded if the purchase proves unsatisfactory. At other times, periodical advertising is intended only to arouse interest, and the reader is urged to ask for further information; the sale is then made with the aid of follow-up letters and booklets. Sometimes both appeals are combined in one advertisement: "Send only \$2. Or ask for booklet."

The appeal of the third kind of mail-order campaign is different from that of the other two. The house that sells many different kinds of things by mail usually advertises in periodicals chiefly for the purpose of getting a list of names of people to whom a catalog may be sent. The catalog of such houses is relied on to make the sales. A few direct orders may come as a result of periodical advertisements that feature particular things, but, in general, the periodical advertising is intended to distribute catalogs rather than to make immediate sales.

We have divided mail-order campaigns into three groups on the basis of the differences of appeal and method. Still another classification might be made. Some mail-order campaigns are directed to consumers; others are directed to dealers. Butler Brothers and the Baltimore Bargain House are examples of large concerns dealing by mail with dealers. We are to consider chiefly mail-order campaigns of those who sell to consumers; the methods of such campaigns

differ but slightly from the methods of selling by mail to dealers.

2. *The mail-order specialty advertiser.*—One has only to open any magazine of general circulation to find offers by mail-order specialty houses representing nearly every class of human wants, including cigars, lessons in nursing, apples, furnaces, books and even automobiles.

Twenty years ago Alois P. Swoboda developed a plan of physical culture, and traveled from place to place organizing classes and selling his instruction for from ten to fifty dollars for the course. He found that his principal difficulty lay not in selling the course but in getting business men to find time to attend the lectures. He decided that this difficulty could be obviated if the lessons were given by mail, and the pupils were instructed to take the lessons in their own homes at whatever time might be most convenient for them. He told his plan to an advertising agency, but the agency was very skeptical of its possibilities. That he would be able to collect twenty dollars thru the mails for lessons in physical exercise seemed too much to expect. Swoboda was not disheartened, however, and decided to insert a one-page advertisement in *Munsey's*. The cost was \$600. Within a month that first advertisement had brought in orders for the course totaling over \$6,000.

This remarkable success is typical of many other early mail-order campaigns. Observing these successes, people began to think that anything could be

sold by mail, and at relatively small cost. This is not true. Some things cannot be sold profitably by mail, and the cost of making mail sales seems to be steadily rising. Swoboda had conducted his mail-order business for about ten years before he found that the cost of obtaining an inquiry and of converting it into a sale was increasing so greatly that it was no longer wise to rely solely on the advertising and the mail follow-up to close sales; in many cases it was cheaper to send salesmen to get the orders after inquiries had been secured thru advertising.

3. *Requirements of mail-order specialty house.*—As has been said already, not everything can be sold profitably by mail. In considering the advisability of launching a mail-order specialty business one of the first questions to be asked is, "Are my possible customers near enough to me so that the transportation charges on the smallest unit will not materially affect my price in competition?"

When the parcel post was established, many new opportunities were opened for mail-order specialty houses. The specialty shoe house is an example. By shipping by parcel post, one mail-order shoe house found its average cost of transportation was eleven cents a pair, against a previous charge of thirty cents. The difference allowed a good profit and induced many concerns to go into the business. While some advertised in the farm journals, most of them bought special lists of names and then advertised directly with catalogs and letters.

The matter of transportation cost, however, is only one of the many expenses to be considered in selling by mail. Most things can be sold by mail if enough money is spent in the process. The great problem of the prospective mail-order advertiser is: "Is there a sufficient margin between the cost to manufacture and the price at which I can sell my goods by mail to pay all the expenses of this kind of selling and still leave me a profit?" Many mail-order campaigns have failed because this question has not been properly considered in advance. A manufacturer once attempted to sell a talking machine attachment by mail for one dollar. His manufacturing cost was less than fifty cents, and he assumed that the difference between cost and selling price was ample to cover all expenses, and leave him a good profit besides. He found that it actually cost seventy cents to make each sale; he was losing twenty cents on every article sold.

4. *Influence of style centers.*—One of the reasons why people buy wearing apparel by mail is that they feel they get better styles when they buy, sometimes from distant firms, thru the mails than when they buy in their own communities. Because New York is supposed to originate, or to be the first to import, styles in women's clothing, such mail-order houses as the National Cloak and Suit Company and Bellas, Hess Company do a large business with women all over the United States. The desire to buy in the style centers is responsible for much mail-order buying.

Within ten years one New York mail-order house has built up an exclusive ladies' ready-to-wear mail-order business with 2,500,000 customers, and is spending over \$2,000,000 a year on catalogs and other advertising. This company issues five catalogs—a large one for spring and summer, another large one for fall and winter, and three smaller catalogs for special lines. The large books go out in editions of 2,500,000, and cost \$750,000 for each of the two seasons. Five to ten per cent of the mailing list “dies” every year.

As is usually the case with those who sell by mail, this company gives an absolute guarantee of satisfaction or money refunded. Only one garment in fifty is returned for alteration or exchange. The average order is for about six dollars' worth of goods.

Style is the first consideration, and the business is built on this principle. Magazine advertisements offer “leaders” at attractive prices in an effort to get orders for the leaders, and thus to establish trade relations. After this relation has once been established, catalogs are sent to the customers each season. If a customer has not ordered for two seasons, it is customary to drop her name from the list.

5. *Costs of mail-order specialty advertising.*—There is no other kind of business in which returns from advertising can be so accurately checked as in the business of the mail-order advertiser. By careful tests he can find out exactly the particular size of space he can most profitably use and the particular

appeal and wording of the copy that brings the greatest returns. Different sizes of space are experimented with, and the cost per inquiry and the cost per sale are carefully tabulated for each size. The space that results in the most profitable proportion between cost and returns is then adopted as the standard. Every word in the copy is carefully scrutinized. The change of a single word may mean the difference between profit and loss. When the advertiser has once found a piece of copy that results in maximum sales, he often uses the copy unchanged as long as it continues to "pull" satisfactorily.

Many mail-order specialty houses use only one-inch advertisements. Others use profitably still smaller space. A canoe manufacturer selling by mail has for several years confined his copy in the *Saturday Evening Post* to half-inch advertisements, finding that whenever the space was increased there was no profit in the business.

6. *Using records in choosing mediums.*—Not only can size of space and kind of copy be standardized; the mediums used can also be chosen, by tests, with absolute knowledge of their comparative usefulness to the advertiser. Those mediums that bring returns at a cost below the maximum set by the advertiser are continued on the list; all others are dropped.

The method of testing mediums is illustrated by the records of a magazine that conducted a subscription campaign by means of advertisements in a long list of magazines and newspapers. The size of space

varied somewhat in different mediums, but both the size of space and the copy were sufficiently uniform to permit a fair comparison among the different mediums on the basis of the actual results recorded from the advertising in each one. Some of the tabulated results were as follows. Names of publications are not used because it would not be fair to the mediums to show actual results unless all the many conditions surrounding the campaign were likewise stated. Some of the mediums were used more than once.

	<i>Cost of the advertisement</i>	<i>Number of subscriptions sold</i>	<i>Cost per subscription</i>
Magazine A	\$40	51	\$0.79
Magazine A	40	20	2.00
Magazine B	250	338	.72
Magazine B	250	181	1.38
Magazine C	37	47	.80
Magazine D	200	234	.85
Newspaper A	12	17	.71
Newspaper B	90	258	.35

When records of this sort are continued over a long enough time and the results of various insertions in the same magazine are averaged and compared with other average returns from other mediums, the advertiser can definitely pick those publications that, for his particular purpose, bring the most results for the least money.

7. *Difficulties of specialty mail-order selling.*—Women are said to be better mail-order buyers than men. There is a variety of suggested reasons: Some people contend that women read advertise-

ments more carefully than men—that careful perusal of an advertisement is essential before an order will be sent by mail, and that men have less time to read carefully. Others say that men are less inclined than women to ask for their money back when they are dissatisfied with a purchase. When a guarantee of “satisfaction or your money back” is made, a woman will ordinarily act on it if she is not satisfied, but many men will pocket their loss and give the seller no opportunity to remedy the trouble. Many men, therefore, rather than risk loss, refrain from buying by mail even when the advertiser makes a plain offer of money back in case of dissatisfaction. Other reasons also are advanced, but, whatever the reason, the seller of goods to men by mail usually has a rather difficult task.

The many attempts to sell cigars by mail have proved the necessity of great attention to details in trying to get mail orders from men. One cigar manufacturer offered “Genuine Havana Seconds” at \$1.90 a box as a mail-order leader. With the goods was sent an attractive catalog illustrating forty other kinds of cigars. It was expected that the real profit would come from orders for higher-priced cigars from men who originally bought the “Havana Seconds.” It was found, however, that there were only twenty-five per cent of reorders, and that many of them were for the “Havana Seconds” rather than for higher-priced goods. Also, the manufacturer gradually was made to believe that many original pur-

chasers did not like the "Havana Seconds," and that, despite the absolute offer of "money back if not satisfactory," they neither reordered nor gave the manufacturer a chance to "make good." There seemed to be an inherent weakness somewhere in the selling plan. The problem was threefold:

1. To devise a plan which, without increasing the size of the advertisements, would increase the percentage of first orders.
2. To increase the proportion of reorders.
3. To increase the orders for higher-priced cigars than the "Havana Seconds."

The first purpose was realized by a radical change in the copy; it was given much greater attention value and told the story almost at a glance. The second and third purposes were achieved by a new offer: "To each purchaser of 100 Havana Seconds we will extend the privilege of ordering, for 60 cents additional, one of our Sample Cases containing one sample cigar each of our 12 Best Sellers—all Bargain Values—price up to \$12 per 100. Include this in your order—it's the biggest sample value we ever offered."

The sixty cents really paid the wholesale cost of the box of samples, so there was no actual loss on the transaction. The seeming attractiveness of the offer induced a large increase in orders, each one of which paid for itself no matter whether there were reorders or not; and there was a considerable increase in the percentage of reorders, most of them

being for the higher priced cigars which were sent in the sample box.

8. *Selling by mail to get distribution.*—When a manufacturer attempts to induce dealers to handle his goods he is often met with the statement: “We will handle your goods if you will first create a demand for them.” To meet this situation, a manufacturer may decide to sell direct to consumers by mail. Then, when he can show a certain number of people who are regular users of his goods, dealers are ordinarily glad to handle them. That it is possible to create a demand thru the mails, and later to turn the business into dealer channels, is evidenced by the experience of the Lindstrom-Smith Company, of Chicago, manufacturers of vibrators and other electrical appliances.

I sold by mail-order exclusively until four years ago, when the expressed interest of the dealers became so strong that I decided to go after the dealer business in a whole-hearted fashion. Contrary to the expectation of some of my friends, the ratio between mail-order and dealer sales in my business during the last four years is as follows:

	<i>Dealer</i>	<i>Mail-Order</i>
1912	25%	75%
1913	50%	50%
1914	70%	30%
1915	80%	20%

Yet my mail-order business has increased absolutely at a greater rate each succeeding year, altho we refer mail-order inquiries to dealers when there is a dealer in the prospect's locality. The reason for this, I think, lies largely in the attitude we take toward the dealer. We sincerely believe that

our mail-order methods are the best, if not the only possible means of "sampling" the country for the dealer's benefit.

Some manufacturers attempt to obtain dealer distribution and to do a mail-order business at the same time. Dealers in most cases do not like this. If a manufacturer who has a dealer in a community tries to induce him to push sales of the manufacturer's goods, and yet accepts direct mail orders from consumers in that community, the dealer is not to be blamed if he is not enthusiastic about the manufacturer and his product. There are two accepted methods of overcoming this difficulty. The more common is for a manufacturer who receives mail orders to fill direct orders from communities in which he has no dealers, to turn over to his retailers mail orders that come from territories in which there is a distributor. The other method is for the manufacturer to fill mail orders direct, but to give dealers their profits on business from their communities, even when the manufacturer fills the order himself. A dealer who receives a check for a transaction in which he has had no part is inclined to feel that he is overlooking a profit by not handling the manufacturer's line, and he is likely to be entirely willing to cooperate with a man who treats the trade so fairly.

9. *Department store mail-order campaigns.*—As methods of transportation are improved and as the people of any trade territory gain confidence in the department stores in the large cities, these establishments find themselves more and more forced to in-

stal mail-order departments. Many of them do not carry on extensive mail-order campaigns; they accept such mail orders as come to them, but do not go out actively after mail-order business. Others use different kinds of direct advertising, and some advertise for mail orders in periodicals. A common method is to depend on the suburban circulation of newspapers to bring in orders by mail as a result of the regular newspaper advertisements.

There is difference of opinion as to whether a department store should publish regular mail-order catalogs.

There are only a few department stores that try to do business by mail over large sections of the country. The regular department store buyers are often not competent to judge the requirements of the country trade, and, unless a special mail-order stock is maintained separate from the stock for the store, many items listed in a catalog are likely to be sold out before mail-order customers order them. Perhaps the most general practice among progressive department stores is not to carry a separate mail-order stock, nor to issue complete mail-order catalogs, but, instead, to issue frequent small bulletins of regular current store offerings, all of them subject to prior sale; or to encourage mail orders in newspaper copy, and then to build up mail-order trade by careful attention to orders when they are received.

10. *General mail-order distributors.*—The campaigns of the great mail-order houses that sell almost

numberless things over wide sections of the country are too well known to need much description. Most of these houses use periodicals, reaching people more or less distant from large and well-stocked stores, chiefly for the purpose of getting the names of people to whom complete catalogs may be sent. Then these names are followed up with a great variety of attractive direct advertising matter until the prospect has become a regular customer or until his case has proved hopeless. As was shown in a previous chapter, some of the mail-order houses have grown to such tremendous proportions that there are few periodicals they can profitably use to add more names to their lists.

11. *Mail-order successes and failures.*—The public is inclined to believe that selling by mail is easy and that there is little expense or risk in it. As a matter of fact the number of mail-order failures probably greatly exceeds the number of successes. People are so familiar with the large volume of business done by a few of the better known mail-order establishments, that many are tempted to go into the mail-order business for themselves, without adequate capital and without the careful preliminary study which such a business requires. In no line of selling activity is it possible to be successful without intensive investigation of the thing to be sold, the people to be reached, the methods of reaching them and, above all, the probable costs of conducting the enterprise. All these things are particularly neces-

sary in undertaking a mail-order business. Costs of doing business are the rock on which many such businesses have been wrecked. But if the risks are great, the opportunities are equally large. Hundreds of business houses, now finding a limited market for their goods, can, with proper preparation, greatly enlarge their field and their sales by cultivating the trade which in many cases can be quickly, safely and profitably reached thru the mails.

### REVIEW

Could a ten-cent loaf of bread be sold profitably by mail? A fifty-cent book? A dollar razor? What considerations determine the answer to this question?

How do the three kinds of mail-order advertising campaigns differ in purpose and method?

Do you buy by mail? If so, what sort of things? What mail-order advertising appeals influence you? Could you use these same appeals in advertising to others?

Have you studied the possibility of using the mails to increase the sales of the business with which you are connected? Have you looked thoroly into the matter of costs, competition, number of possible purchasers, methods of reaching them, etc.? Many businesses do not try to develop sales by mail, simply because they have never given the matter careful consideration.

## CHAPTER XIX

### PUBLIC SENTIMENT CAMPAIGNS

1. *A new use for advertising.*—Advertising to mold public sentiment is new. Only recently has the world begun to understand the great power of advertising to accomplish things entirely outside the field of commerce. The public service corporation, the political party and even the government are gradually coming to realize that advertising may be perfectly dignified, that people are influenced by advertising, and that, if a cause is just, a straightforward statement over the signature of a responsible individual or company will more quickly change public sentiment than any other known means.

The most important requisite for such advertising is the same as the essential requisites of commercial advertising—there must be quality in the article advertised. The cause of the advertiser must be just. Advertising will only accelerate the failure of an organization if its product does not have quality; and advertising to create a certain public sentiment will only injure the advertiser if the judgment of the masses considers his cause unjust.

2. *The campaign versus the press agent.*—Before the days of the public sentiment campaign, the press

agent often was used to get free publicity. The desire of corporations, individuals, cities and political parties to mold public opinion is nothing new. Only the methods are new. Formerly it seemed to be the general opinion that it was the duty of the newspapers to give free publicity on any subject that had even the slightest claim to public interest. If a retail dealer bought a new counter, the local paper must mention it in its news columns. If the charity organization wanted funds, a carefully planned advertising campaign in space bought and not begged, was seldom thought of. If a railroad had anything to say to the public, as a matter of course it told the editor to say it—and the editor usually did. At one time the use of brick as a building material was largely increased by a press agent campaign; newspapers were flooded with stories about the great loss to the country occasioned by the burning of frame structures. Hundreds of different kinds of businesses have sought to wheedle editors into telling their story, instead of buying space in his paper to tell it.

The press agent still survives. Organized baseball and theaters still get tremendous amounts of free publicity. Automobiles are still "press agented" to some extent. There is scarcely a day that even the least influential editor is not urged to lend his news and editorial columns to the furthering of some private interests or some public interests backed by an active organization. The press agent still has his place; and certainly the newspapers and magazines

will always devote much space to worthy causes and to matters of real public interest. But the editor is getting wary. The individual or the corporation with an axe to grind is no longer made at home in the offices of publications.

Then, too, people who wish to influence public opinion are beginning to realize that a well-displayed advertisement is likely to be seen and read by more people than the same story told in the news columns. It is this realization that has had most to do with the decreasing importance of the press agent and the increasing number and importance of real advertising campaigns designed to sell ideas instead of goods. When carefully planned advertising campaigns are paid for and carried on successfully for such movements as those represented by the National Security League and the Belgium Relief Committee, no one need hesitate to use advertising to accomplish any worthy purpose that depends for its success on the acceptance of an idea by the multitude.

3. *The decline of free publicity.*—Many people believe that the Panama-Pacific Exposition in San Francisco would have been more largely attended if it had been advertised widely in paid space. Months before the exposition opened, a joint committee of the American Newspaper Publishers' Association and the Quoin Club, under the chairmanship of the president of the Associated Advertising Clubs of the World, presented to the board of directors of the exposition a plan for an international advertising cam-

paign. It was rejected on the ground that the exposition was of international importance, and that newspapers would be glad to give all the publicity desired free. The management of the exposition estimated that the publicity would draw from one to two million visitors from the East. After the exposition closed, railroad officials estimated that the travel to the exposition from east of the Rockies totaled only 400,000. The suggested advertising plan would have involved the investment of not more than \$500,000. The exposition is said to have spent almost \$400,000 in obtaining free publicity. The chairman of the joint committee that drew up the plan for the advertising campaign believes that "if the exposition management had turned this very respectable amount of money over to one of our leading national advertising agents and dispensed entirely with its own publicity department, it would have enjoyed fully as effective free publicity plus the advertising space that that considerable amount of money would have purchased. And that advertising space would have doubled the attendance from the East."

4. *Political advertising campaigns.*—The Lincoln and Douglas debates of 1860 marked the end of the period when politicians relied chiefly on the human voice to sway public sentiment. Then came the era of free publicity. It is not yet at an end, but it is drawing to a close. Mark Hanna is said to have been the first political leader to buy advertising space for use in a presidential campaign. Since that time paid

political advertising has greatly increased, until in the presidential campaign of 1916, it played an exceedingly important part in the activities of both the great parties.

Reliance on free publicity in a political campaign is singularly futile. Nearly every newspaper is partisan, and it is read almost entirely by members of the party with which it is affiliated. Those readers do not, ordinarily, need to be convinced of the advisability of voting for the candidate of their party. And yet free publicity for the Republican party will be received only by Republican newspapers, and free publicity for the Democrats can be inserted only in Democratic papers. The Republicans want to convince Democratic voters, and the Democrats want to convince Republicans. The only way any party organization can talk effectively in print to members of the other party is in papers read by those members; and the only way in which they can tell their story in those papers is by purchasing space in the advertising columns.

In planning a political advertising campaign it is customary now to employ trained advertising men, who study the problem just as a manufacturer studies his marketing problem. The normal vote of all parties is ascertained, the conditions affecting the probable vote in each state are charted, a study is made of the special party appeals that ought to be successful in reaching each different class of people, and the appropriation is divided among those me-

diums that will best reach the classes aimed at. Each state is given attention in proportion to its normal vote, its electoral vote and the degree of difficulty that is expected in convincing the voters. All publicity mediums are used.

5. *Forestalling objections to increased rates.*—In 1911, the Hudson & Manhattan Railroad, operating the “tubes” under the Hudson River, found it necessary to raise the fare on one of its divisions from five cents to seven cents. The company decided to take the public into its confidence and to convince its patrons that the increase was justified. The president of the company thus expressed its policy:

The same old question of policy presented itself: Should we anticipate the public’s objection by immediately giving, in line with our practice, a full statement of our reasons for the increase, or should we (following the usual railroad custom) simply file our tariff, and, if a protest was filed, meet it then with a statement of the facts? Without hesitation we decided to issue immediately a full statement and to *publish* it (notwithstanding the large cost) as an advertisement in the daily papers of New York City and vicinity.

Our policy has been based on the consistent belief that the public is reasonable—as reasonable as the average individual. This is not the view of most corporation managers. They have acted too much on the hypothesis that the public is *unreasonable*. It is a mistake. The public is *unreasonable* only when it is *uninformed*. It is often vitally affected by corporate action, but rarely does the corporation manager make it acquainted with the facts on which alone rational and intelligent opinion may be founded. He would rather establish his position, or do the thing in hand as long as he believes he has the right, without the labor of explanation, even tho it involves the loss of popular approval. Why? Be-

cause it is less trouble and, anyway, what can the public do about it? He does not realize that in the arbitrary exercise even of undeniable rights, the consequences of public disfavor and ill-will are far-reaching, manifesting themselves at times in unexpected quarters and on unrelated subjects, to the great injury or disadvantage of the corporation.

Even where the corporation has an undisputed right to do a thing—particularly if that thing vitally affects the public—it is far better to accomplish it *with* than *without* the favor and approval of the public. There is no corporation, however strong, whose property and assets are not enhanced in value and made more secure by possession of the goodwill and friendship of the public. This is merely common-sense, or “enlightened self-interest,” so called. And so we set out to convince the public that the increase of rate was just and reasonable.

Newspaper advertisements were used and pamphlets were distributed in the trains. The company's case was stated frankly and fully. Many commendatory letters were received from patrons and the campaign occasioned much favorable comment. When the increased rates went into effect, there was no decrease in traffic, and very little difficulty of any sort was experienced.

6. *Advertising for fair play.*—A gas company controlling a monopoly in a city of 350,000 population entered into an agreement with the city council allowing the council to fix rates every three years, provided only “that no rate should be so fixed as to fail to afford a fair return on the capital investment of the company.”

At one of the rate-fixing periods the city council employed an expert to determine what would be a

fair rate. He recommended a decrease from eighty-five to seventy cents a thousand cubic feet, maintaining that the gas company's property was worth only \$4,318,178, altho the company has been paying taxes on an assessed valuation of \$7,078,520 which was fixed by the city. Despite the apparent injustice, the council seemed determined to accept the recommendation and to establish the lower rate. It would have been impossible for the gas company to get the newspapers to present the company's case editorially, because, as the editor of one of the papers said, "If there is even the slightest suspicion these days that a newspaper is favoring a public service corporation, the cry goes up that it has 'sold out,' and half its usefulness is gone." Accordingly, the company was forced to advertise to carry its case to the people.

Full-page advertisements were used in all the papers, with daily insertions during the ten days preceding action by the council. Each advertisement was signed by the president of the company. All the advertisements formed a logical series, and yet each one stood alone as an effective presentation of the company's case. The story was told in a straightforward manner, combining the logical appeal of a lawyer with the narrative style of a newspaper story. Supplementing the newspaper advertising, a booklet was sent to every influential citizen, suggesting that he speak to his alderman if he were convinced of the justice of the company's position.

The campaign did not keep the city council from

lowering the rate, but it did result in a later compromise which was satisfactory both to the citizens and to the gas company.

7. *Advertising to win strikes.*—When employes of a company go out on strike, a considerable portion of the public always jumps to the conclusion that the cause of the strikers must be just and that the employer must be in the wrong. Public sentiment has a decided influence on the success or failure of a strike, particularly when a public service corporation is affected. Public sentiment can often force arbitration, or, if it is sufficiently aroused, it can bring one side or the other to speedy terms. When public sentiment is on the side of the strikers, simply because they are strikers, the employer has a difficult task to obtain a fair hearing. Free publicity in the newspapers is seldom effective, because of the popular suspicion of the disinterestedness of some editorial utterances. Therefore many employers tell their story to the people by means of an advertising campaign. Newspapers are usually employed, also posters, booklets distributed on trains, and other mediums are used in some instances.

In the fall of 1916, within a period covering only a few weeks, the newspapers in New York City carried advertisements presenting the side of the employers in three strikes in which the public felt great interest. The street railway companies, when confronted by the possibility of a general strike, immediately took large space in the papers and continued

to tell their story to the public until the service, temporarily tied up by the strike, had become nearly normal again. A few weeks later a strike was declared by the individuals supplying milk to the great milk distributing companies. The distributors at once put their case before the people thru the mediums of advertising. The distributors did not win the strike—public sentiment campaigns are not always successful—but they aroused a degree of public sentiment in their behalf which would have been impossible without the campaign. A less spectacular use of advertising was that employed by a chain of grocery stores in New York City. A strike was declared by the drivers of its delivery wagons, and the company presented its case in small advertisements, asking the indulgence of the public until the delivery service could be reorganized.

Strikers use advertising to sway public sentiment less often than employers. When the influencing of public sentiment is necessary, however, there is no reason why properly planned and conducted advertising campaigns should not be used by either side in a strike controversy.

8. *Advertising for general good-will.*—When a public service company has a virtual monopoly in its field, it ought to be eager to build up popular good-will, not so much to increase the immediate sale of its services, as to establish a strong foundation of popular approval which will serve as a bulwark against the future competition that is sure to come.

An interesting campaign of this sort was undertaken in the latter part of 1916 by the Pullman Company. The company began at that time a series of advertisements calling public attention to the various features of Pullman service, and reminding readers of the tremendous increase in the ease of traveling brought about by the developments in the equipment and in the service of the Pullman Company. A campaign that has a similar purpose has been carried on for some years by the American Telephone and Telegraph Company.

Advertising alone, of course, cannot build good-will for a public service corporation any more than advertising alone can make sales. The goods and the policy of the house must be right if sales are to be made; advertising can only reflect the solid facts of quality and service. In a similar manner, a corporation can build good-will only if it deserves good-will; the advertising can only carry to a wide audience the policy of the corporation, which is reflected in its actual dealings with its patrons. It can remind the public of points in the company's service which might otherwise be forgotten, but success cannot be expected if the experience of the public does not coincide with the impression sought to be created by the advertising.

9. *Cooperative public sentiment campaigns.*—Differing only in magnitude from public sentiment campaigns conducted by single corporations, is the campaign carried on by a group of interests operating co-

operatively when they are confronted by the common necessity of taking their case to the people. A recent spectacular example was the effect of the leading railroads of the company, assisted by nine advertising agencies, to avert threatened labor troubles in the summer of 1916. Seventeen thousand newspapers were used to carry the railroads' case to the public. Fourteen thousand of these were weeklies reaching people in small communities.

10. *Size of advertisements in public sentiment campaigns.*—With few exceptions campaigns to influence public sentiment are comparatively short. No matter how closely the point at issue may affect the public's interests, newspaper readers are likely to tire quickly of a controversy carried on by means of advertisements. Accordingly, the message of the advertiser must be presented boldly, quickly and in as striking a manner as possible. This ordinarily requires the use of large space. The public sentiment advertiser wants to be sure that most of the readers of a paper will see his advertisement and that they will read it. Large size advertisements with attractive white space display are the best methods of accomplishing this purpose. Furthermore, the story is seldom a short one; if it is put in small space it is likely to be crowded and to be forbidding in appearance. Many public sentiment campaigns use full pages only; others are able to get effective publicity in somewhat smaller space. Only in rare cases can a successful attempt be made to sway public senti-

ment by means of small single or double-column advertisements.

11. *A campaign to advertise advertising.*—A unique use of advertising was exemplified in the campaign begun by the Associated Advertising Clubs of the World in 1915, to tell what advertising has done for the country and to urge the purchase of advertised goods. Magazine and newspaper space was widely used with attractive display to advertise advertising. The result of a campaign of this sort cannot be measured; public sentiment is an intangible thing that is slow in crystallizing, and often slow in expressing itself. No campaign to build good-will can measure its returns in dollars and cents. Nevertheless the power of advertising has been proved; and, if any cause is worthy, there can be no question that well-planned advertising, properly conducted, can go a long way toward swinging public sentiment in its favor.

12. *Cooperative campaigns for specific industries.*—Akin to public sentiment campaigns are the campaigns conducted cooperatively by various industries to increase the consumption of the products of those industries. Among the industries that have attempted on a large scale to increase consumption have been the fruit growers, various groups of lumber interests, cement manufacturers and the producers and distributors of dairy products.

Probably the most successful and spectacular of these campaigns is the one conducted by the Cali-

ifornia Fruit Growers' Exchange. As early as 1896, this organization of growers of oranges and lemons adopted the "Sunkist" trade-mark and began to market fruit cooperatively. This organization acts as a clearing house for its members and markets the fruit at actual cost. Seventy-five branch offices were originally established in the principal cities thruout the country. These officers were in daily telegraphic touch with headquarters, and kept the home office informed of the state of the local fruit markets. They saw that shipments to each district paralleled local demand, thereby freeing the industry from the violent price fluctuations that always accompany the marketing of a perishable product when no organized attempt is made to correlate supply and demand.

The Exchange began advertising in 1900. In 1916, its advertising appropriation had nearly reached the \$500,000 mark. In the decade between 1905 and 1915, the population of the United States increased twenty-one per cent. In the same period the consumption of California oranges increased seventy-four per cent. The California Fruit Growers' Exchange forwards nearly seventy per cent of all the citrus fruit shipped from California. The operating cost to the shippers represents one and six-tenths per cent of the gross sale, with an additional charge of six-tenths of one per cent for advertising. It is said that the marketing cost of the California Fruit Growers' Exchange is less than that for any other commodity, regardless of its nature. The success of the Exchange

is a striking tribute to the value of organization, backed by vigorous, persistent advertising.

13. *Advertising a city.*—Campaigns to advertise cities are not strictly public sentiment campaigns. They are sales campaigns, intended to sell the city and its opportunities to factories looking for a home and to people looking for a desirable place to live in or to visit. Nevertheless, because they are conducted in the interests of groups of people instead of single individuals or companies, and because they are not concerned with the sale of merchandise, they have more in common with public sentiment campaigns than with any other kind of advertising.

Some cities advertise to bring tourists and conventions. The cities of the Pacific coast have done this to a large extent. Others wish to attract factories and to bring in permanent residents. This is a newer development in city advertising than advertising for tourist trade. Many cities have tried it—some of them in a spectacular way. A few years ago Des Moines, as “the city of certainties,” was heralded in the advertising columns of many national magazines. Magazine advertising, however, is by no means the only sort of publicity that cities use to build up the communities. There is scarcely a chamber of commerce or commercial club in the United States that has not a more or less carefully planned campaign to attract visitors, interest factory owners and bring in residents. Usually the campaign consists entirely in the use of direct mediums. Booklets describing the

city and its advantages are the mainstay of the publicity. These booklets may be supplemented by letters, trade excursions and a variety of other things that are expected to attract attention to a community and to arouse interest in it.

The value of city advertising depends on several things. First, there must be something to advertise. Unless there are some real reasons why people should buy a certain commodity it will do no good to advertise that commodity. In like manner, a city that has no real advantages as a factory site or as a place of residence can scarcely expect to get results from advertising. The trouble with many town promotion campaigns is that there was no adequate "study of the product" before the campaign was undertaken. An analysis will often show that a town needs to "clean house" in many different ways before it can afford to set out consciously to attract attention to itself. Advertising that is better than the article advertised is as bad for a city as for a manufacturer.

Actual recorded results of city advertising campaigns are difficult to get. A few are available, however. Among them perhaps the most successful recorded results were from a campaign conducted by Nashville in 1911. Booklets were prepared; magazines and newspapers were used; and local campaigns with personal workers were carried on for short periods in the leading cities of the country. The reported expenses and results were as follows:

## EXPENSES

Direct advertising (23 pieces)	\$20,000
Periodical advertising	25,000
Office expense	10,000
Factory sites and assisting factories	12,000
Entertainment of conventions	14,000
Sundry expenses	17,000
	<hr/>
	\$98,000

## RESULTS

74 new factories  
292 conventions

That it does not require excessive expenditures to build up a city if the city really has something to offer and the campaign is properly conducted, is indicated by the experience of Calgary, Alberta. In 1914, with an advertising expenditure of only \$11,000, Calgary was successful in attracting twelve new manufacturing enterprises.

14. *Advertising a state.*—The members of the Portland Commercial Club, realizing that Portland is the largest city in Oregon, and estimating that of every dollar earned in the state sixty cents is spent in Portland, as early as 1907 developed a plan to advertise the State of Oregon and its resources. The Oregon Development Association was formed by the members of the Portland Commercial Club. Their motto is: "Not one cent to advertise Portland—everything for Oregon."

Advertisements were inserted in many periodicals in order to elicit inquiries for literature about the

state. Commercial clubs were organized in all the small towns, and a bulletin was issued twice a week to these commercial clubs giving the names and addresses of inquirers, together with the specific subjects in which they appeared to be interested. The Oregon Development Association mailed a booklet and a letter to each inquirer, and each community selected from the names of inquirers certain people on whom it concentrated its efforts.

As an example of how this plan worked, consider the case of Creswell, Oregon. When Creswell associated itself with the campaign it was thirty-two years old, had a population of 300 and did not have a bank. A commercial club was organized, and an appropriation of \$1,500 to supplement the advertising of the Oregon Development Association was subscribed. The secretary of the commercial club asked each resident to fill out a card giving the section of the East in which he had once lived or in which he had friends. These cards were arranged geographically; when a list of inquirers was received from the Oregon Development Association, the local secretary entered into correspondence only with people located in districts where the inhabitants of Creswell had friends. The secretary kept in constant telephone communication with the people in the town, and each inhabitant arranged a follow-up series of personal letters of his own to persons living near his old eastern home, who, by responding to the advertising of the Oregon De-

velopment Association, had shown an interest in the West and its opportunities. Not only would the father of the family write to the inquirer, but the children would write to the children of the inquirer, and in some cases the wife of the Oregon man would write to the wife of the Easterner telling of her experiences in Oregon, and urging the eastern woman to consider moving West and becoming a neighbor again. Thru such cooperative effort has the West been built. In two years Creswell doubled in population. The adjacent farm lands trebled in value. The new bank was a thriving institution. Concrete sidewalks were laid. New buildings went up, and the inhabitants of Creswell proved to the world that no city is too small to advertise.

15. *Advertising a nation.*—Some of the most interesting uses of advertising have developed since the beginning of the European war. The experience of Great Britain with its elaborate poster and newspaper advertising campaign for recruits is well known.

While the United States government in its recruiting departments, both of the army and of the navy, has long appropriated a certain amount of money for advertising purposes, the experience of Great Britain demonstrated to the United States more clearly than before the necessity of having in readiness a definitely planned advertising campaign appealing to volunteers in case of war. At the Philadelphia convention of the Associated Advertising

Clubs of the World, a committee was appointed representing in its membership all the advertising mediums. This committee prepared and submitted to the United States government a complete plan for an advertising campaign for recruits, which is in readiness for instant use if it should ever be needed.

In 1916, the five leading engineering associations of the United States, realizing the necessity of industrial and military preparedness, proposed to the Naval Board a survey of the industries of America in an effort to determine the classes of articles, their quantity and quality, which could be furnished to the government in case of hostilities. That the manufacturers of the country might know of the work of the engineers, the Associated Advertising Clubs of the World, thru its committee on national preparedness, conducted an advertising campaign in newspapers, magazines, trade papers and on posters, telling manufacturers what the engineers were doing to facilitate their work. At the completion of the survey the engineers reported that they had been favorably received everywhere and that they would not have been able to make the investigation in so short a time if it had not been for the advertising campaign conducted in their behalf.

## REVIEW

What is the first requirement of a public sentiment campaign?

Do you believe that paid advertising on a large scale is advisable for a great exposition? Why?

What two things can a monopoly hope to accomplish by advertising?

When workers strike, why does the employer advertise?

Many city advertising campaigns fail. Why?

Can you think of things the United States government might accomplish by advertising, other than those mentioned in the chapter?

## CHAPTER XX

### THE CAMPAIGN AS A WHOLE

1. *Final problems of the advertiser.*—At the conclusion of our study of advertising campaigns there remain three important things to be considered. They are not all closely related, but for convenience they are grouped together in a final chapter. The first of these three subjects is the necessity of altering the plans for a campaign from time to time, as unexpected conditions develop, or as results from the original plans dictate a realignment of the advertising forces so as to insure success of the advertiser. The second subject is a study of the several ways of binding together all the various forces in a campaign. And the last is a small group of universal advertising laws that must constantly be borne in mind by everyone who hopes to build business with the aid of advertising.

2. *Changing the plan to bring results.*—It is evident to anyone who studies the variety of problems that have to be solved by the man who prepares a plan for an advertising campaign, that no plan is infallible. There are few definite rules of procedure. In only a small minority of instances can an advertiser say, "This is what I must do because experience has proved

it to be the best thing to do." But no amount of study can guard against errors in human judgment. Some plans for campaigns are sure to be wrong, no matter how carefully they have been made.

The possibility of a mistake in judgment makes it necessary for the advertiser to keep on the watch constantly for indications that his campaign is not doing what it was intended to do. If results do not come, if expenses amount alarmingly, if new competition develops, or if any one of many other things happen, it is time for the advertiser to take his plans apart, find the weak point and bolster it up if possible, or if something fundamental is wrong, to discard the old plans entirely and start off afresh on a new track.

3. *A selling plan that was wrong.*—The campaign of the Review of Reviews Company to sell the *Photographic History of the Civil War* some years ago illustrates admirably the necessity that often arises of changing a plan for a campaign after the campaign is under way. The *Photographic History* was a set of books containing reproductions of photographs actually taken during the Civil War. The peculiar nature of the books offered unusual advertising opportunities. Large space was taken in magazines and newspapers and the copy was excellent. An elaborate follow-up was prepared. The advertising campaign began almost before the books were ready for the market, and continued on a large scale for more than a year. The periodical advertising was not intended to make sales; inquiries only were sought, by

means of a coupon in each advertisement. It was expected that the follow-up would close the sales.

The coupons came in by the thousands, the follow-up was set to work, and results eagerly awaited. Many sales were made, but they were slow in coming. At first this did not greatly trouble the publishers. The man in charge was experienced in the selling of books by mail. He did not expect immediate results, because he realized it takes time to turn inquiries into sales without the use of salesmen. Furthermore, he knew that many people would not even send in a coupon until the cumulative effect of the advertising had time to influence them.

Feeling sure that only time was necessary to make the carefully planned campaign show results, the manager went on a vacation for a few weeks. When he returned, instead of finding that sales were materializing in satisfactory volume, he found only an average selling cost of thirty dollars a set, which was the total price paid by the consumer. Something had to be done, and done quickly. *Printers' Ink* describes the way in which the problem was solved:

There was nothing serious the matter with the copy, for inquiries were coming in steadily. The follow-up was complete and elaborate, and was being sent out promptly. But something manifestly was wrong, for the number of those who had sent in coupons but hadn't ordered the books was increasing at a stupendous rate. Since the magazine copy seemed to be above reproach, the trouble must be in the follow-up, and careful analysis located it. The follow-up was interesting, it was artistic, it was well written, but it failed

to give the inquirer an adequate impression of the size and comprehensiveness of the edition. It stimulated desire for the books, but not to the extent of thirty dollars' worth. It was instantly recognized that the only way to "cash in" on cumulative effect was to give the people the opportunity to see the books themselves, since in this way only could they be convinced of the full value of the goods.

The entire edition was turned over in November to John Wanamaker and the advertising continued under the name of the Wanamaker Book Club. The books were conspicuously displayed in the store, and an easy payment plan of purchase was inaugurated. The results were immediately apparent, and the profits arrived on schedule. During the first twenty days of April, the sales aggregated five-elevenths of the total sales during the entire campaign. In other words, out of a total sale of some forty thousand sets, nearly half were sold during the last twenty days. Of course there is nothing to prove that the results would not have come if the course originally followed had been adhered to, but the probabilities are strongly against it. What made the difference between success and probable failure was the disposition to find out what was really the matter.

4. *Adapting campaign to local conditions.*—An advertising and selling plan seldom has to be changed entirely after it has once been undertaken. Often, however, it must be adjusted in some minor way to meet changed conditions. Usually the adjustment involves added sales activity at some points and rearranged plans for local advertising at other points. The general plans for an advertising and sales campaign may be justified by the general business conditions in the country, and yet the varying conditions in different localities may make necessary a rapid shift in some of the attempts to link up national ad-

vertising with intensive work on dealers and consumers in individual towns.

There are many sources of information for the advertiser who wants to keep in close touch with local business conditions to the end that he may spend his money in the places where it is most needed and where it will do the most good. Chief reliance is ordinarily placed on the reports of salesmen. If salesmen are trained observers, valuable information can be obtained from them about the business of the merchants in the towns they visit. Such information should be carefully weighed, however; some salesmen are inclined to report conditions poor, as an excuse for small sales, or because in their own line things are generally slow, when other lines are not affected.

The commercial agencies can be of great help in picturing business conditions in different sections of the country. The advertiser who tries to get inquiries or to make sales by mail can often ascertain conditions in different localities by comparing returns from these advertisements, place by place and month by month.

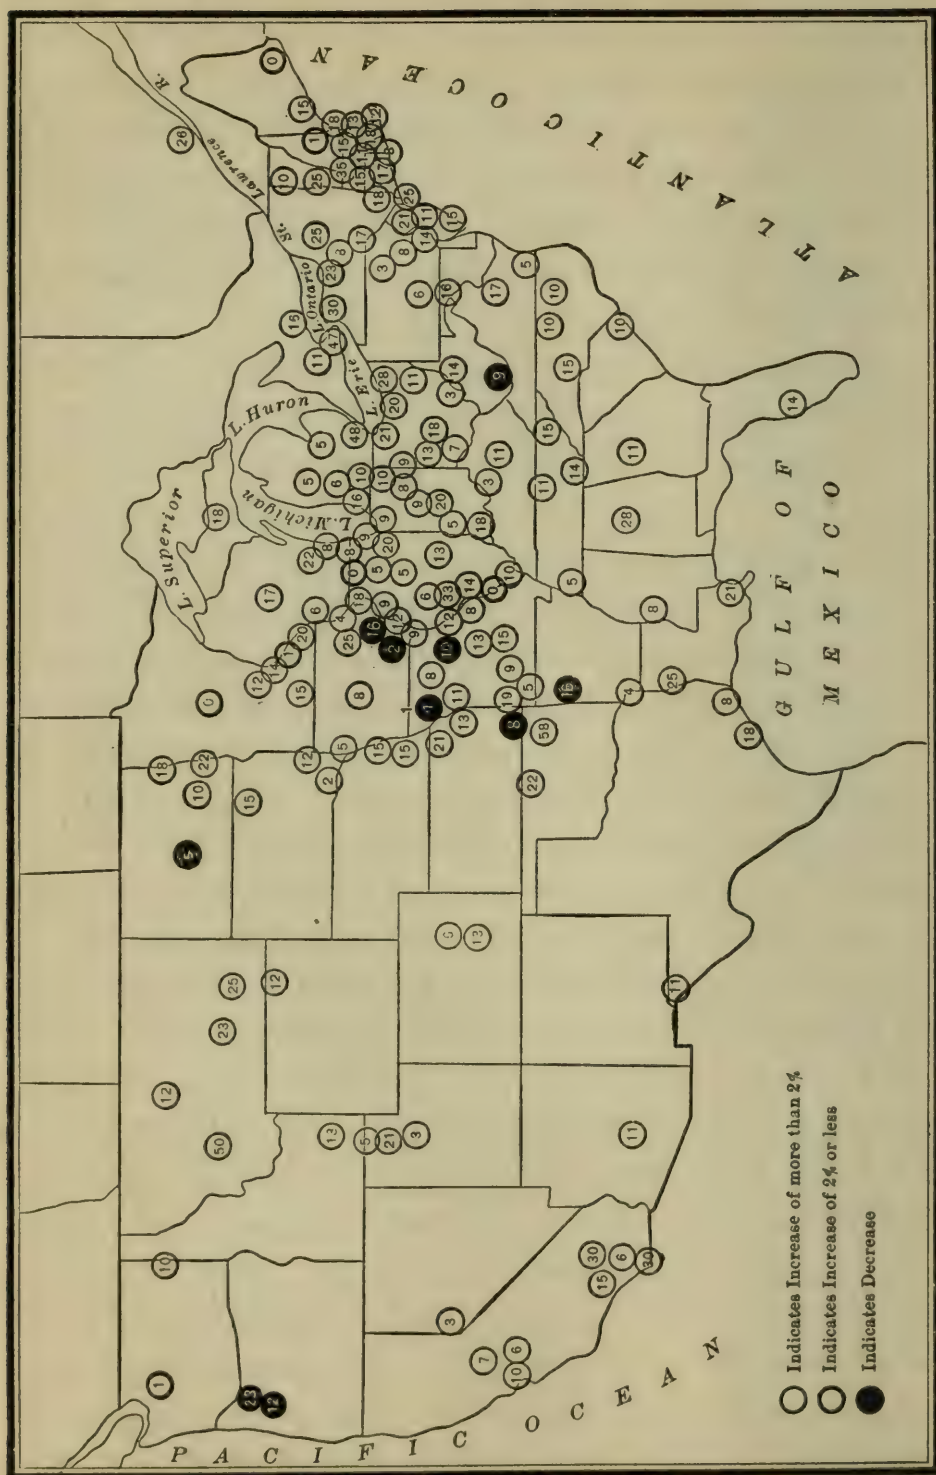

One of the most interesting attempts to aid the advertiser to adapt his campaign to local conditions was inaugurated some years ago by the Research Committee of the Associated Advertising Clubs of the World. Every year during one of the winter months the members of the committee visit representative dealers in the principal lines in all the leading marketing centers and obtain from their books records of

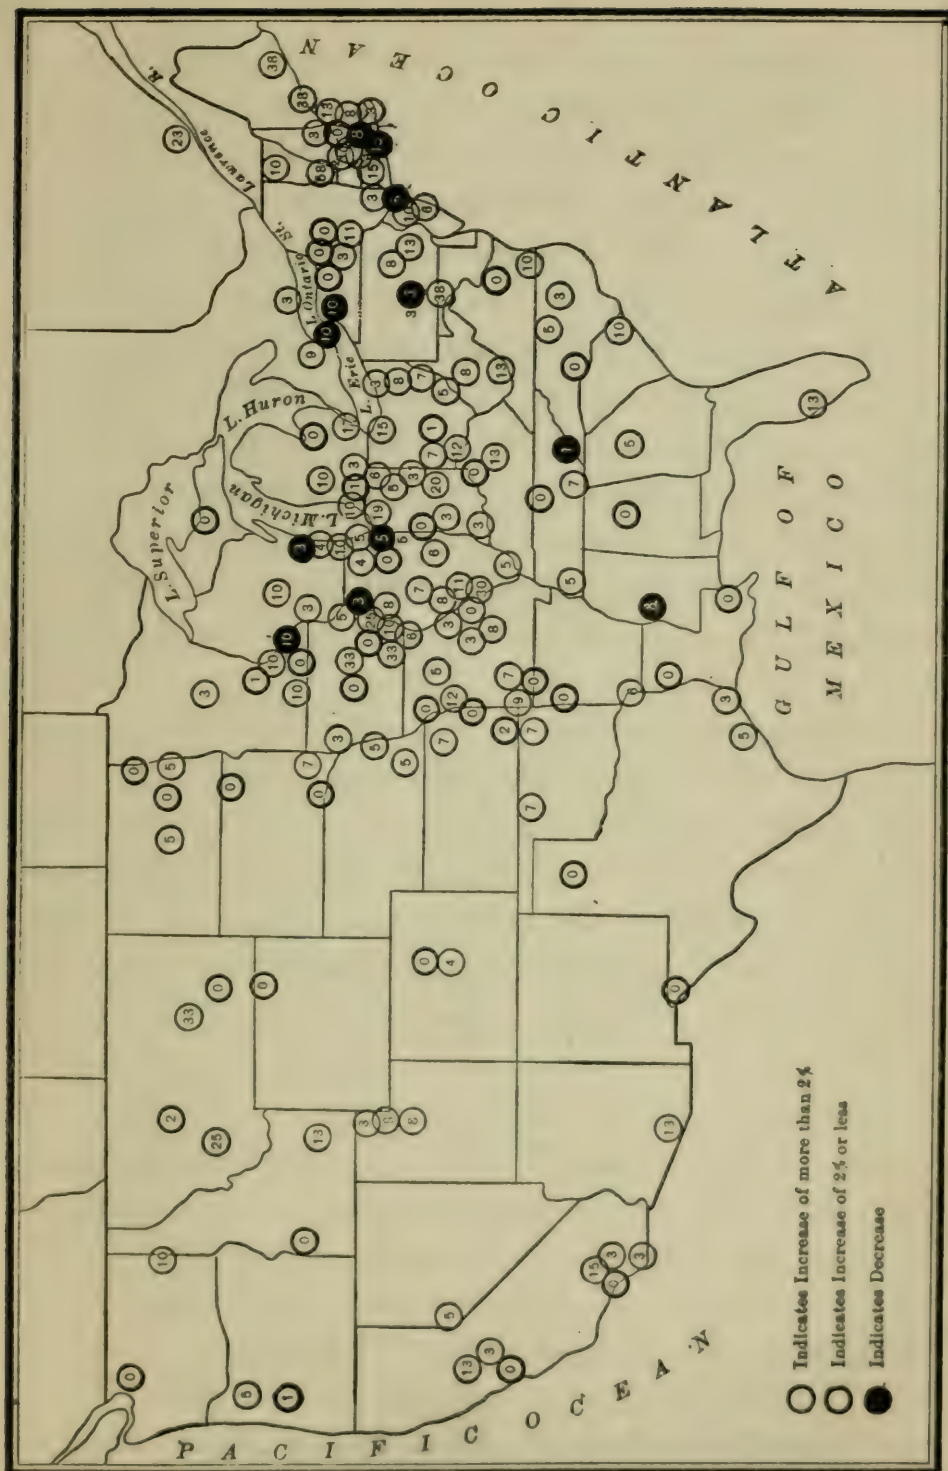

the sales, collections, net profits and stocks carried for the month during which the investigation is conducted and also for the same month of the preceding year. From these figures maps are prepared showing the trend of trade in the more important business centers of the country.

On the following pages two of these maps are shown. They represent the conditions in the drug trade, as reported by the Associated Advertising Clubs in January, 1916. The first map shows percentages of increase or decrease in sales by drug stores for a month, compared with sales in the same month of the previous year. The second one shows similar percentages of increase or decrease in the average stocks carried by drug stores. These maps can be used by the advertiser in various ways. For instance, the druggists of Buffalo report an increase in sales of thirty per cent, but with a ten per cent decrease in stocks. Such a situation ought to provide an opportunity for intensive dealer work in Buffalo, to induce the druggists there to increase their stocks. Or if Valley City, North Dakota, shows a decrease of five per cent in sales and an increase of the same percentage in stocks, the time seems to be ripe there for a special drive on consumers to relieve the congested condition of the stocks. The individual advertiser, of course, before taking action on the basis of these reports, must compare his own sales records with the local figures. If his own sales to druggists in a certain city have largely increased during the

year, he can conclude that his business in that city is in a satisfactory condition even tho the general stocks in the city may be reported as being low. If a city shows a substantial increase in sales, and his own sales to dealers have fallen off, he should consider the advisability of a strong local dealer or consumer campaign, regardless of the general conditions of stocks.

These reports are of value to the retailer as well as to the manufacturer. A New Orleans druggist may be congratulating himself on a ten per cent increase in sales. If the average increase for druggists in his city is twenty-one per cent, he may find it advisable to take steps to bring his business up to the average.

5. *Unifying the campaign.*—An advertising campaign is deserving of the name only when all parts of it work together for a common end, and when they are so related that there is no conflict, no lack of harmony, but simply a smoothly running piece of sales machinery with a definite function and a definite place for each cog and each wheel. Advertising has suffered in the past because of the failure to give a common characteristic to all the publicity of a given advertiser, and because of a lack of appreciation of the fact that advertising and sales must be closely coordinated if there is to be maximum efficiency and minimum waste. The careful advertiser gives his attention to four problems in coordination. (1) He sees to it that all his advertising has an individuality that binds the whole together into a single effective

sales weapon. (2) He makes sure that his salesmen believe in his advertising and that they work with it instead of against it. (3) He shows dealers (if he sells thru dealers) how to tie up their own store display and their own newspaper advertising to his efforts to bring consumers into their stores. (4) He organizes his own factory and office so as to insure that every member of his organization personifies the spirit and policy of his publicity. The first of these problems in coordinating the parts of the campaign was considered in detail in Chapter V.

6. *"Selling" the advertising to the salesmen.*—Many salesmen do not understand the purpose and the methods of advertising. Sometimes they suspect that the increasing importance of advertising means the decreasing importance of the salesman. It is necessary, therefore, for the advertiser to be sure that his salesmen not only understand the function of advertising in general, but also that they are fully in sympathy with the purposes of his own publicity.

This attitude of some salesmen toward advertising is not unnatural. In the past, the advertising man has not been a part of the sales organization; he frequently made his plans without consulting the sales department. Under this illogical arrangement the salesmen often were not told of the advertising plans in advance; they did not know what advertising was to be done until they saw the advertisements themselves or until dealers called attention to them. Naturally the salesmen resented being left out of the

plans; their lack of knowledge of the activities of the house reflected adversely on them and on their employer. The modern executive avoids these unfortunate conditions, either by putting personal salesmanship and advertising under the supervision of the same man, or by insisting that all advertising plans be worked out in cooperation with the sales department, and by taking steps to see that the salesmen are told about the advertising, that they believe in it and use it in every possible way to increase their sales.

Advertising is "sold" to salesmen in a variety of ways. At sales conventions it is customary to have the advertising manager explain in detail the plans of the coming season, to answer questions, and to obtain the enthusiastic cooperation of the salesmen. House organs are often used to tell the men about the advertising, to explain the purpose of it and to show them how the salesmen can make the most of it. Some advertisers go so far as to explain in detail to salesmen, thru the house organ, the reasons why the different advertising mediums are used.

The most common method of keeping the salesmen in touch with the advertising is to send copies of advertisements to the men in the field for their own information, and also to help them in explaining the campaign to dealers.

The tactful advertising manager is often able to ask advice from salesmen, and to retain their interest and cooperation by showing them the reasons for his con-

clusions, even if he finds it necessary to reject their suggestions.

7. *"Selling" the advertising to dealers.*—When goods are distributed thru dealers, there is bound to be waste in the advertising unless dealers are familiar with it and use it in every possible way to increase the sale of the advertiser's goods. It was pointed out in Chapter XVI that the dealer's cooperation cannot be expected unless the advertised goods are of good quality and carry a satisfactory profit for him. If these conditions are fulfilled, then efforts should be made to tie up the dealer and the advertising in such a way that one will supplement the other. Dealers should be informed of the advertising that is to appear. This information may come either by mail or thru the salesmen. Salesmen often carry portfolios showing future advertisements, schedules of mediums, circulation of mediums by states and by towns, and other information designed to interest the dealer in the campaign and to enable him to coordinate his sales efforts with the local and national advertising of the manufacturer. Then, just before any advertisement is to appear, the dealer receives a reminder from the manufacturer. In this way the dealer can arrange to make a display of the goods to take advantage of the advertising, or he can advertise under his own name, in the papers or by signs in his window, that he is the distributor for the advertised goods. Another method of linking up the dealer and the national advertising is to furnish the dealer with

cuts that are similar to the ones used in the manufacturer's advertising.

8. *Putting the organization behind the campaign.*—An advertising campaign is the expression of the advertiser's sales policy. It is his most important way of talking to the public and of telling them about himself and his goods. But it is not the only way. Every letter that goes out from a business establishment advertises that establishment. It creates a good or a bad impression, and the bad impression may be so bad that no amount of general advertising can remove it. Every time an employe of a business house comes into contact with the public he helps or he hurts his employer. No matter how casual may be the personal contact between visitors and employes of the store, office or factory, every time there is any personal contact the visitor receives a good or a bad impression of the house that the employe represents. The factory can nullify thousands of dollars' worth of advertising by failing to turn out satisfactory goods, by failing to take proper care of orders, by failing to make prompt deliveries and by failing to do many other things which good service demands.

It is not a difficult matter to tell the public about high ideals, courteous service, careful attention to orders, good products and honest treatment, but it is often a very difficult matter to be sure that every employe of the advertiser lives up to the spirit and policy behind the advertising. The advertiser who fails to see that all the members of his organization

are imbued with his ideals and that they do their best to back up the advertising, is failing in a very important respect in coordinating the various things that go to make up a successful advertising campaign.

One advertiser says, "I want every one of my advertisements to be so written that, when they are shown to my employes, everyone in my plant from the office boy to the most skilled engineer will feel a pride in the organization." He realizes that no matter how good may be the quality of the raw material, the quality of the finished product depends on the skill and intelligence of the labor, and skill and intelligence will be exercised to the degree that the workers take pride in their tasks. There are many instances in which the spirit of an organization has been greatly improved by inspiring in the employes the desire to live up to the spirit and promises of the advertising.

9. *Two fundamental laws of advertising.*—There are two basic laws which every advertising man should understand and apply to his advertising campaign. While both have already been referred to in a general way, we have left a detailed discussion of them for the last chapter, so they may have the emphasis that they deserve. The first is a law of economics; the second is a law of psychology. The first is the law of diminishing returns. The second is the law of repetition and cumulative effect. In a sense they are two balancing forces. They are to advertising what centrifugal and centripetal force respectively are

to physics. The first limits the advertiser. The second provides him with his opportunity.

10. *The point of diminishing returns.*—The principle of diminishing returns rests on two laws of economics. The first is: That the resultant power of one unit is greater than half the power of two units. The second is: That every element has its boundaries.

One man or one horse or one advertisement working singly is likely to accomplish more than half as much as two working together. Two men or two horses or two advertisements working together are usually more efficient than four working separately. The most efficient unit is, therefore, one man, or one horse, or one advertisement. Every time you add a salesman to your payroll you have to add an additional expense for supervision—an additional expense in teaching that salesman how to drive in the team with the other salesmen. A business man who is his own salesman requires no supervision. When he adds another man to help him sell, he is required to spend part of his time supervising the sales of the other man and teaching him the business. When he has added four or five salesmen, he finds that they require so much supervision that he is compelled to give up selling himself, and to spend all his time supervising and directing the efforts of his salesmen in order to develop proper team work.

As the business grows he discovers that the combined efforts of himself and the five salesmen do not

give him as large a percentage of profit on his investment as when he was working alone. A sales manager and five salesmen usually cost more per thousand dollars' worth of goods sold than six times what one man working alone costs per thousand dollars' worth of goods sold.

Then as a business grows, there comes a time when there is no possibility of increased sales in the immediate neighborhood; in order to develop, the business must branch out into new fields. This calls for traveling expenses for salesmen, which perhaps doubles the former sales expense without bringing anything like proportionate returns.

Thus it is with all business. As supervision and territory are added, expenses increase faster than returns. Even volume ultimately reaches a limit. There comes a point when the amount of additional expense required is exactly equal to the return that will be received. This is the point of diminishing returns. Beyond this point it is unprofitable to proceed. If it were not for this law, the fact that an advertising expenditure of \$1,500,000 brought the Procter and Gamble Company \$83,000,000 worth of business, might persuade the company to spend \$3,000,000 or \$6,000,000 in advertising the coming year on the theory that the increased expenditure would bring \$166,000,000 or \$332,000,000 worth of business.

Every advertising campaign has before it a point of diminishing returns. It is farther away in some

businesses than in others. When there is a strong element of "repeat" in an article, the point of diminishing returns may be far in the future. It is much nearer if a product is such that only one sale can be made to each customer.

Indications that a business is approaching the point of diminishing returns may be found in the steady rise of the cost per inquiry and the steady rise of the cost per sale. The day when increased expenditure will not bring adequate returns may be postponed in some cases. The field of operations may be extended, or new products may be added which will carry prestige already established and which can be sold without much additional sales expense. But if progress continues, the point of diminishing returns is bound to be reached sooner or later in every business. That increased expenditure for advertising cannot continually bring increased returns is no indictment of the power of advertising. It is a fundamental law of nature.

11. *Cumulative effect of repetition.*—The second of the two laws of advertising that we are considering has a direct bearing on the necessity of coordinating all the parts of an advertising campaign. It rests on two laws of human nature. The first says: "Attention and interest cannot be maintained except momentarily on a stimulus that remains absolutely the same." There must be something new and changing about it. The reader can, of course, voluntarily force his attention for a brief period on an advertisement, but such attention cannot be continued long unless the

object reveals some suggestion or idea that is of new interest to him.

The other law states: "Attention and interest cannot be maintained on a stimulus which is absolutely without meaning—a stimulus of which the reader has had no previous cognizance." We must have some link with a past experience by which we can compare a present experience, or we immediately lose interest.

Everything that holds our attention and interest must have two elements—an element of the old and an element of the new—an element of repetition and an element of novelty. The most engrossing and interesting experiences are new experiences in old surroundings or old experiences in new surroundings. If the experiences and surroundings are both new we lose interest, just as we tire if the experiences and surroundings are both old and have become commonplace to us. Our continued interest in any object depends partly on our familiarity and association with that object, and these in turn depend on repeated contact with it.

It is the same with advertisements as with anything else that claims our attention. We welcome the advertisements of Ivory Soap and Cream of Wheat as old friends. No two of them are quite the same, and yet there is something about every one that causes ready recognition and that induces growing interest and good-will. The advertiser should strive to make the reader regard his advertisements as he regards his friends. We expect a friend always to have the same

color of hair, the same features, the same height and the same mannerisms. These things remain constant, but other things about him change. He does not always wear the same clothing. He does not always talk about the same things. If he is a friend worth having, he is likely to bring to you some new idea every time you meet him. Each contact with him develops a better understanding. If his ideas are always good, his manner always pleasant, his sincerity always evident, each meeting will add to your respect for him; and the more you respect him, the more willing you will be to act on his suggestions. So it is with advertisements. Their success depends largely on their persistence, on the readiness with which the reader recognizes them, and on the amount of respect that he is made to feel for the advertiser and the advertiser's goods.

12. *The family resemblance of advertisements.*—A noted psychologist once said: "It is the generic family resemblance that some of the great national advertisers adhere to in their advertisements which gives the cumulative inheritance of power." Many advertisers are unable to comprehend this principle. There is no coordination in their advertising campaigns. Their advertisements inherit no power from their predecessors. Their advertisements do not look alike. But above this, their advertisements are not so constructed as to transmit any power. They urge one thing today and another thing tomorrow. In the advertisements of today they make claims which they

contradict or prove false in the statements they make tomorrow. They have no consistency either in appearance or purpose. They live from hand to mouth. It is these advertisers who most quickly find the point of diminishing returns. They are building not on a foundation but on the ground.

The first way to give advertisements that subtle something which we call character and which the psychologist calls generic family resemblance is to build them on fundamental business policy. Many organizations do not know that they have business policies until they begin to prepare advertisements. There are certain policies of honesty and fair dealing which should be fundamental with any organization. There are other policies of trade developed with experience. Each year new policies develop or changes are needed in old ones. Each year the far-sighted employer sets down the policies of his organization and endeavors to express them in his advertising campaign.

The other method of obtaining and retaining character in all the advertisements of a campaign is in the physical make-up. This, too, may change from year to year, just as a man may change his style of dress as he grows older. It is not to be supposed that one concern will use the same style of border or the same type in all its advertisements year in and year out. But there should be something which carries the reader's mind from advertisement to advertisement—something which provides the connecting link with past experience, while offering opportunity for

the constant change that is necessary to hold attention.

In Chapter V we listed thirteen ways in which advertisers can give physical unity to their campaigns. There should be no haphazard choice of one of these distinguishing features of a campaign. Whatever is chosen should have a real meaning. The finding of that meaning is one of the arts of advertising.

Perhaps you know a man who always wears a broad-brimmed felt. The wearing of that hat is a part of his personality. When you think of him you think of the hat. They seem to belong together. Other men, possibly, wishing to emulate him, wear the same sort of hat. Their efforts are incongruous; broad-brimmed felt hats are not the natural headgear for them. Instead of adopting the distinguishing outward characteristic of another individual, they should wear the hat that best merges into their own peculiarities of face, stature and character. So it is with advertisements. The physical make-up as well as the message of the advertisement must represent the character of the advertiser and his organization.

Advertising is expression. It is more than words on paper. Advertisements are the representatives of the organizations paying for them. They should be like those organizations, look like them, live like them.

A truly successful advertising campaign is not developed by formula. It is an expression of character. And in so far as that character is strong, as that character is steadfast, as that character is true,

to that extent, and to that extent only, may the campaign be expected to succeed.

### REVIEW

Specifically what is meant by coordinating all the parts of an advertising campaign? If you were planning a campaign, what different problems in coordination would you have to solve? How would you solve them in your business?

How can advertising react on the advertiser and his employes?

Why cannot increased investments in advertising continue indefinitely to bring profitable business?

Do you believe in the business-building power of honest, consistent, persistent, interesting, attractive advertising? Could it be profitably used in the business with which you are connected? Many businesses have entered new eras of development after giving careful consideration to this question.
